The *Sepia officinalis*, common in the Mediterranean, is chiefly sought for the profusion of color which it affords. This secretion, which is insoluble in water, but extremely diffusible through it, is agitated in water to wash it, and then allowed slowly to subside, after which the water is poured off, and the black sediment is formed into cakes or sticks. In this form it is used as a common writing-ink in China, Japan, and India. When prepared with caustic lye it forms a beautiful brown color, with a fine grain, and has given name to a species of monochrome drawing extensively cultivated. The probability is that the use of *Quadragesima Sunday* for the first Sunday in Quadragesima or Lent, and the independent use of *Quinquagesima* for the fiftieth day before Easter (both included), led to the extension of the series by the inexact application of the names *Sexagesima* and *Septuagesima* to the two Sundays preceding. Also called *Lost Sunday, Alleluia Sunday.* See *Sunday.*

The Seventy—that is, the seventy (or more) persons who, according to the tradition, made a translation of the Hebrew Scriptures into Greek. The rounded legend is that the translation was made by seventy-two persons in seventy-two days. In another view, the Seventy were members of the sanhedrim (about seventy in number) who sanctioned the translation.

The *Septuagints* translation. *Minsheu.*

2. A Greek version of the Hebrew Scriptures made by the Seventy (see def. 1): usually expressed by the symbol LXX ('the Seventy'). This version is said by Josephus to have been made in the reign and by the order of Ptolemy Philadelphus, King of Egypt, about 270 or 280 years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually; but the translation is believed to have been completed by the second century B. C. The Septuagint is written in the Hellenistic (Alexandrine) dialect, and is linguistically of great importance from its effect upon the diction of the New Testament, and as the source of a large part of the religious and theological vocabulary of the Greek fathers, and (through the Old Latin version of the Bible (see *Italic*) and the influence of this on the Vulgate) of that of the Latin fathers also and of all western nations to the present day. In the Greek Church the Septuagint has been in continuous use from the earliest times, although other Greek versions (see *Hexapla*) were anciently also in circulation, and it is the Old Testament still used in that church. The Septuagint contains the books called *Apocrypha* intermingled among the other books. It is the version out of which most of the citations in the New Testament from the Old are taken. Abbreviated *Sept.*

W. K. Clifford, Lectures, I. 205.

Specifically—(*a*) In *bot.*, any kind of a partition, whether a proper dissepiment or not: as, the *septum* in a seed; the *septum* of a spore. (*b*) In *anat.* and *zoöl.*, a partition; a wall between two cavities, or a structure which divides a part or an organ into separate portions; a dissepiment. In vertebrates the formations known as *septa* are most frequently situated in the vertical longitudinal median line of the body, but may be transverse or otherwise disposed. A number of them are specified by qualifying words. See phrases following. (*c*) In *corals*, a calcified mesentery; one of the six or more vertical plates which converge from the wall to the axis of the visceral space, dividing this into a number of radiating loculi or compartments. Each septum appears single or simple, but is really a duplicature of closely apposed plates, just as the mesentery itself is a fold. They are to be distinguished from the horizontal dissepiments, or tabulæ, which may cut them at right angles. They are variously modified in details of form, may be connected by synapticulæ, and are divided, according to their formation, into *primary, secondary*, and *tertiary.* (*d*) In *conch.*, one of the transverse partitions which separate the cavity of the shell of a cephalopod into chambers. Cloquet, and better called *septum femorale.*—**Septum femorale**, the septum crurale. *H. Gray*, Anat. (ed. 1888).—**Septum linguæ**, the partition of the tongue; a vertical median layer of fibrous tissue dividing the tongue into right and left halves. It sometimes includes a cartilaginous rod, as the lytta or so-called "worm" of a dog's tongue. Also called *septum pellucidum, septum medium, septum ventriculorum, ventricular septum, septum medullare triangulare.* See cut under *corpus.*—**Septum narium**, the partition between the right and left nasal cavities or meatus of the nose. In man it is formed chiefly by the mesethmoid, or perpendicular plate of the ethmoid, the vomer, and the triangular cartilage of the nose.—**Septum nasi.** Same as *septum narium.* In zoölogy it is often restricted to the surface between the openings of the right and left nostrils, which may be of this or that character, deeply cleft as in the hare, hairy or naked, etc.—**Septum orbitale** or **orbitarum**, the orbital partition; any formation which separates the right and left eye-sockets. The term is less frequently used in relation to mammals, whose eyes are generally small and far apart, than among lower vertebrates, as birds, whose orbits are very large comparatively, and separated only by a thin vertical plate of bone, which may be perforated, or so far defective that the opposite orbits are thrown into one large cavity.—**Septum pectiniforme**, the pectinated septum of the penis, a median vertical partition between the right and left cavernous bodies of that organ. In man it is a dense, firm fibrous structure with many vertical slits, through which the blood-vessels of the opposite sides communicate freely, this comb-like appearance giving the name. It sometimes includes an ossification, the os penis or penis-bone, as in the dog, racoon, etc. Also called *septum penis.*—**Septum pontis**, the septum of the pons Varolii.—**Septum rectovaginale**, the wall which separates the rectal from the vaginal cavity.—**Septum scroti**, the partition between the right and left cavities of the scrotum.—**Septum sphenoidale**, the mesial partition between the sphenoidal sinuses.—**Septum transversum**, the diaphragm; the transverse partition between the thoracic and abdominal cavities.—**Septum ventriculorum**, or **ventricular septum.** (*a*) The partition between the right and left ventricles of the heart. (Endlicher, 1847), named from *Sequoiah*, *Sequo Yah* (also called George Guess), an Indian of the Cherokee tribe, who invented an alphabet and taught it to his tribe.] A genus of coniferous trees, of the family *Pinaceæ* and tribe *Taxodieæ*. It is characterized by an oval cone, with persistent woody scales each bearing about five ovules, and dilated upward in fruit into a rhomboidal wrinkled and flattened slightly prickle-tip-

Part of one of the Big Trees (*Sequoia Washingtoniana*), Mariposa Grove, California. (Diameter, 30 feet.)

ped apex. The flowers are monœcious, terminal or axillary on young shoots, with their scales spirally set. The small and involucrate staminate flower consists of an oblong column of united stamens, bearing crowded ovate connective scales, each with three to five anthers. The compressed seed bears a thick spongy margin, and contains four to six seed-leaves. There are but two species, both Californian, and ranking among the most remarkable of trees, growing straight, tall, and columnar, with short densely spreading branches, soft red wood, and very thick fibrous and spongy bark. They bear acute, compressed, and keeled decurrent narrow leaves, which are alternate and spirally inserted, or spread in two ranks on the younger branches. Their small cones ripen in the second year. For *S. sempervirens*, discovered by Menzies about 1794, see *redwood*, 1. The other species, *S. Washingtoniana*, the *Wellingtonia* of English gardens, is the mammoth tree or big tree of the Sierras of California. It is a less graceful tree, with shorter branches, pendulous branchlets, paler appressed leaves, its wood a duller red, with thin white sapwood, its bark near the ground one to two feet thick, and its cones much larger (two or three inches long). It forms a series of forests in Tulare county, California, isolated groves extending 260 miles northward, and it has been recently reported from southern Oregon. The tallest tree now known, one of the Calaveras grove, is 325 feet high; one in the King's River forest is 35 feet 8 inches in diameter inside the bark 4 feet from the ground, and its age is estimated at over 4,000 years. Both species were early classed under *Taxodium* (which see), their nearest American living relative; a closer ally, however, is *Athrotaxis* (Don, 1839), a genus of three Tasmanian trees distinguished by a cone with mucronate or umbonate scales; their other living relatives are a few distant and mostly monotypic genera of Japan and China. A very large number of fossil species are known with certainty, showing that the genus was much more abundant in late Cretaceous and Tertiary time than at present.

The army [of Pumpernickel] was exhausted in providing guards of honor for the Highnesses, *Serenities*, and Excellencies who arrived from all quarters.
Thackeray, Vanity Fair, lxiii.

Serenoa (sē-rē'nō-ä), *n.* [NL. (Sir J. D. Hooker, 1883), named after Dr. *Sereno* Watson, curator of the herbarium of Harvard University.] A genus of palms, of the tribe *Sabaleæ*. It is distinguished from the genus *Sabal*, the palmetto, in which it was formerly included, by its valvate corolla, and fruit tipped with a slender terminal style, and containing a somewhat cylindrical seed with sub-basilar embryo and solid albumen. One of the 2 species, *S. serrulata*, is found from North Carolina to Florida and Texas, and is known as *saw-palmetto* from the spiny-edged petioles. It is a dwarf palm growing in low tufts from a creeping branching caudex, which is clad with a network of fibers. The coriaceous leaves are terminal and orbicular, deeply parted into many narrow two-cleft segments. The white flowers are borne on a long, woolly, and much-branched spadix which is sheathed at the base by numerous spathes. The fruit is black, and about an inch in diameter.

It. *servo*, < L. *servus*, a slave: see *serve*[1].] **1.** A villein; one of those who in the middle ages were incapable of holding property, were attached to the land and transferred with it, and were subject to feudal services of the most menial description; in *early Eng. hist.*, one who was not free, but by reason of being allowed to have an interest in the cultivation of the soil, and a portion of time to labor for himself, had attained a status superior to that of a slave.

The slave, indeed, still remained [in the fourteenth century], though the number of pure *serfs* bore a small proportion to the other cultivators of the soil. . . . But even this class had now acquired definite rights of its own; and, although we still find instances of the sale of *serfs* "with their litter," or family, apart from the land they tilled, yet, in the bulk of cases, the amount of service due from the *serf* had become limited by custom, and, on its due rendering, his holding was practically as secure as that of the freest tenant on the estate.
J. R. Green, Short Hist. of Eng. People, v. § 4.

The *serf* was bound to the soil, had fixed domestic relations, and participated in the religious life of the society; and the tendency of all his circumstances, as well as of the opinions and sentiments of the time, was in the direction of liberation. *Encyc. Brit.*, XIX. 352.

2. A laborer rendering forced service on an estate under seigniorial prescription, as formerly in Russia.

In Russia, at the present moment, the aristocracy are dictated to by their emperor much as they themselves dictate to their *serfs*. *H. Spencer*, Social Statics, p. 461.

The next important measure was the emancipation of the *serfs* in 1861. . . . The landlords, on receiving an indemnity, now released the *serfs* from their seigniorial rights, and the village commune became the actual property of the *serf*. *Encyc. Brit.*, XXI. 102.

3. Figuratively, an oppressed person; a menial. =**Syn.** *Serf*, *Slave*. The *serf* is, in strictness, attached to the soil, and goes with it in all sales or leases. The *slave* is absolutely the property of his master, and may be sold, given away, etc., like any other piece of personal property. See definitions of *peon* and *coolie*. See also *servitude*.

[In this and the next four senses usually spelled *serjeant*.] A servant; a retainer; an armed attendant; in the fourteenth century, one holding lands by tenure of military service, commonly used as not including those who had received knighthood (afterward called *esquires*). One of a body or corps attendant on the sovereign, and on the lord high steward on the trial of a peer; a serjeant-at-arms.—**5.** [In this sense the modern spelling is *serjeant*.] In England and Ireland, a lawyer of high rank. Serjeants at law are appointed by writ or patent of the crown, from among the utter barristers. While they have precedence socially, they are professionally inferior to queen's counsel; formerly, however, the king's (or queen's) premier serjeant and ancient serjeant had precedence of even the attorney-general and solicitor-general. Till the passing of the Judicature Act, 1873, the judges of the superior English common-law courts had to be serjeants; but this is not now required. No serjeants have been created since 1868, and the rank will in all likelihood soon become extinct.

It consisted originally of twenty-four persons, not under the degree of knight, whose duty it was to be in immediate attendance on the king's person. One is assigned by the crown to attend each house of parliament. The lord chancellor, the lord treasurer, and on great occasions the lord mayor of London were each thus attended. One, usually the one attending the House of Lords, is an officer of the Supreme Court, to make arrests, etc.

The custom seems to have existed since the fourteenth century. The rings were presented to the eminent persons who might be present, their value differing greatly: thus, in 1429, Sir John Fortescue mentions the most costly rings as being given to any prince, duke, or archbishop, and to the lord chancellor and lord treasurer of England, rings of less value to earls, bishops, and certain officials, of less value again to members of Parliament, and so on.—**Sergeant trumpeter,** an officer of the British royal household since the sixteenth century, originally charged with the direction of a band of sixteen trumpeters.

[The two spellings *sergeant* and *serjeant* are both correct, and were formerly used indifferently. *Sergeant,* however, is more in accordance with modern analogies, and now generally prevails except in the legal sense, and as applied to feudal tenants, to certain officers of the royal household, and, in part, to officers of municipal and legislative bodies, where the archaic spelling *serjeant* is retained. (Stephens, 1836, as *Sericostomidæ*), < *Sericostoma*(*t-*) + *-idæ.*] A family of peculiar trichopterous insects or caddis-flies, typified by the genus *Sericostoma.* It is a large and wide-spread group, represented in nearly all parts of the world, and comprises (usually) excessively hairy insects, for the most part uniform in color or with few markings. The larvæ generally inhabit streams, and their cases, usually formed of sand or small stones, vary greatly in form.

Sericteria have been compared to salivary glands when consisting of larger or smaller tubes opening near the mouth. Such organs occur in various insects, and in different parts of their bodies. The most important are those of silkworms.

The larva of the antlion has its spinning organs at the opposite end of the body, the wall of the rectum . . . taking the place of the *sericteria.* *Claus,* Zoöl. (trans.), p. 532.

seriema (ser-i-ē'mä), *n.* [See *cariama.*] A remarkable South American bird, whose name is as unsettled in orthography as is its position in the ornithological system. It is usually regarded as grallatorial, and related to the cranes, but sometimes placed with the birds of prey, next to the African secretary-bird, which it resembles in some respects. It is 3 feet long; the wing 15 inches, the tail 13, the tarsus 7½;

the legs are bare above the suffrago; the head is crested with a frontal egret; the bill is red; the bare orbit bluish; the iris yellow; the plumage is dark, but somewhat variegated with lighter colors, and the tall is tipped with white. The seriema inhabits the campos of Brazil and northern Paraguay, and may be domesticated. For its technical names, see *Cariama* and *Cariamidæ*.

The hydrocarbons methane (CH_4), ethane (C_2H_6), propane (C_3H_8), etc., form a series having the constant difference CH_2 between successive members, but all the members having in common great chemical stability, slight reactive properties, and incapacity to unite directly with any element or radical.

In Bentham and Hooker's "Genera" it is a group of cohorts with four stages between it and kingdom; in Engler's system it usually has the rank of an order in zoölogy and is given the ordinal termination *-ales*. In the code of nomenclature adopted by American botanists in 1904 (Canon 4) its use is not recognized except in the sense of a group which may differ with different authors.

8. P. Fletcher, Purple Island, ii. 9.

II. *n.* 1. A scaly creature that crawls on the belly; a limbless reptile; properly, a snake; any member of the order *Ophidia* (which see for technical characters). *Serpent* and *snake* now mean precisely the same thing; but the word *serpent* is somewhat more formal or technical than *snake*, so that it seldom applies to the limbless lizards, many of which are popularly mistaken for and called snakes, and *snake* had originally a specific meaning. (See *snake*.) Serpents are found all over the world, except in very cold regions. Most of them are timid, inoffensive, and defenseless animals; others are among the most dangerous and deadly of all creatures. Some are very powerful, in consequence of their great size and faculty of constriction, as boas, pythons, and anacondas. Those which are not venomous are known as *innocuous* serpents, or *Innocua*; those which are poisonous are *noxious* serpents, or *Nocua*, sometimes collectively called *Thanatophidia*. All are carnivorous; and most are able, by means of their dilatable mouths and the general distensibility of their bodies, to swallow animals of greater girth than themselves. In cold and temperate countries serpents hibernate in a state of torpidity. They are oviparous or ovoviviparous, and in some cases the young take refuge from danger by crawling into the gullet of the mother, whence the common belief that snakes swallow their young. Most serpents can be tamed, or at least rendered gentle, by handling; others, as the rat-snake of India, are almost domestic; but the more venomous kinds can be safely handled only when the fangs have been removed. There is a very general misapprehension respecting the comparative numbers of venomous and harmless serpents. Out of more than 300 genera of ophidians, only about 50, or one sixth, are poisonous, and more than half of these belong to the two families *Najidæ* and *Crotalidæ* (the cobra and the rattlesnake families). The true vipers (*Viperidæ*) and the sea-serpents (*Hydrophidæ*), all venomous, have six or eight genera apiece; and four other venomous families have but one to three genera apiece. The proportion of venomous to non-venomous species is still smaller than that of the genera, as the latter will average more species to a genus than the former. Poisonous serpents are mainly confined to tropical and warm temperate countries; they are more numerous and diversified in the Old World than in the New, and rather more forms are *Proteroglypha* than *Solenoglypha* (see these words). Serpents large enough to be formidable from their powers of constriction belong to the *Boidæ* and *Pythonidæ*. A few families contain very small species, worm-like in appearance and to some extent in habits. A majority of all serpents belong to one family, the harmless *Colubridæ*. See cuts under the various popular and technical names.

And hadde not ben the doublet that he hadde of a *serpentes* skyn, deed hadde he ben with-oute recouer.

Now the *serpent* was more subtil than any beast of the field. Gen. iii. 1.

2. [*cap.*] In *astron.*, a constellation in the northern hemisphere. See *Ophiuchus*.—3. A musical instrument, properly of the trumpet family, having a cupped mouthpiece, a conical wooden tube bent to and fro several times and usually covered with leather, and nine finger-holes very irregularly disposed. Its compass extended from two to four octaves upward from about the third C below middle C, and included more or less diatonic and chromatic tones according to the skill of the performer. Its tone was pervasive, though somewhat harsh. It is said to have been invented by a canon of Auxerre in 1590 for use in church music. It was retained in orchestras until the invention of the contrafagotto, and is still occasionally used in French churches.

4. A hydrous silicate of magnesium, occurring massive, sometimes fine, granular, and compact, again finely fibrous, less often slaty. It is usually green in color, but of many different shades, also red, brown, or gray, sometimes with spots resembling a serpent's skin. There are numerous varieties, differing in structure and color. The most important of these are—precious or noble serpentine, under which term are comprised the more or less translucent serpentines, having a rich oil-green color; foliated varieties, including marmolite and antigorite; fibrous varieties, as chrysotile (sometimes called *serpentine asbestos*) and metaxite. Other minerals more or less closely allied to or identical with serpentine are picrolite, williamsite, bowenite, retinalite, baltimorite, vorhauserite, hydrophite, jenkinsite, villarsite, etc. Serpentine occurs widely distributed and in abundance, forming rock-masses, many of which were formerly regarded as being of eruptive origin, but which are now generally conceded to have been formed by the metamorphism of various rocks and minerals; indeed, it has not been proved that serpentine has ever been formed in any other way than this. The peridotites appear to have been peculiarly liable to this kind of alteration, or serpentinization, as it is called. Massive serpentine has been extensively used for both interior and exterior architectural and decorative purposes, but in only a few localities is a material quarried which stands outdoor exposure without soon losing its polish, and eventually becoming disintegrated. The serpentinous rock commonly called *verd-antique*, and known to lithologists as *ophicalcite*, is a very beautiful decorative material, and has been extensively employed for ornament in various parts of the world. See *verd-antique*.

Serranidæ (se-ran'i-dē), *n. pl.* [NL. (Richardson, 1848), < *Serranus* + *-idæ.*] A family of acanthopterygian fishes, typified by the genus *Serranus*, related to the *Percidæ* and by most ichthyologists united with that family, and containing about 40 genera and 300 species of carnivorous fishes of all warm seas, many of them known as *groupers*, *sea-bass*, *rockfish*, etc. (*a*) By Sir John Richardson, the name was applied in a vague and irregular manner, but his family included all the true *Serranidæ* of recent ichthyologists. (*b*) By Jordan and Gilbert, the name was applied to all acanthopterygians with the ventral fins thoracic and perfect, the lower pharyngeal bones separate, scales well developed, pectoral fins entire, skull not especially cavernous, maxillary not sloping under the preorbital for its whole length, mouth nearly horizontal, and anal fin rather short. The family thus included the *Centropomidæ* and *Rhypticidæ*, as well as true *Serranidæ*. (*c*) In Gill's system, the name was restricted to serranoids with the body oblong and compressed and covered with scales, the head compressed and the cranium normal, the supramaxillaries not retractile behind under the suborbitals, the spinous part of the dorsal fin about as long as the soft or longer, and three anal spines developed. The family as thus restricted includes about 300 fishes, which chiefly inhabit the tropical seas; but a considerable contingent live in the temperate seas. It includes many valuable food-fishes. The jewfish or black sea-bass is *Stereolepis gigas*; the stone-bass is *Polyprion americanus*. The groupers or garrupas are fishes of this family, of the genera *Epinephelus* and *Trisotropis*. Serrasalminæ (ser-ą-sal-mō-nī'nē), *n. pl.* [NL., < *Serrasalmo*(*n-*) + *-inæ.*] A subfamily of characinoid fishes, typified by the genus *Serrasalmo*. They have a compressed high body, with the belly sharply compressed and the scales developed to give a serrated appearance to it; the branchial apertures wide; the branchial membrane deeply incised, and free below; the dorsal fin elongated, and an adipose fin. The teeth are well developed and mostly trenchant. The species are characteristic of the fresh waters of tropical South America. Among them are some of the most dreaded and carnivorous of fishes. By means of their sharp teeth they are enabled to cut the flesh of animals as with a pair of scissors, and where they are found it is impossible for an animal to go into the water without danger. They are attracted by the smell of blood, and congregate from considerable distances to any spot where blood has been spilt. They are best known by the name of *caribe*. Many species have been

described, some of which attain the length of 2 feet, but most are much smaller. See *piraya*.

serrate (ser'āt), *a.* [= Sp. *serrato*, < L. *serratus*, saw-shaped, saw-like (cf. *serrare*, pp. *serratus*, saw, saw up), < *serra*, a saw, prob. for **secra*, < *secare*, cut, and thus akin to AS. *saga*, E. *saw*, from the same root: see *secant* and *saw*[1].] Notched on the edge like a saw; toothed; specifically, in *bot.*, having small sharp teeth along the margin, pointing toward the apex: as, a *serrate* leaf. A *serrate-ciliate* leaf is one having fine hairs, like the eyelashes, on the serratures. A *serrate-dentate* leaf has the serratures toothed. In zoölogy and anatomy *serrate* is applied to very many structures much unlike one another, but having more or fewer similar teeth.—**Serrate antennæ**, in *entom.*, antennæ whose joints are triangular and compressed, presenting a serrate outline on the inner margin: sometimes the outer joints (usually three in number) are enlarged, forming a serrate club. See cuts under *Serricornia* and *serricorn*.—**Serrate palpi**, in *entom.*, palpi whose joints are flat, produced, and pointed on one side.—**Serrate preoperculum**, a preoperculum with numerous parallel denticles on its posterior border.—**Serrate suture**, one of several kinds of cranial sutures in which a large number of small irregular teeth of the edge of one bone interlock or interdigitate with similar teeth on another bone, as in the sagittal, coronal, and lambdoidal sutures. The phrase is sometimes restricted to the interfrontal suture, the sagittal being called *dentate*, and the coronal *limbose*, but the difference is slight, if any, and holds for few animals besides man. See cuts under *cranium* and *parietal*.—**Serrate tibiæ**, in *entom.*, tibiæ which have a row of sharp teeth along the greater part of the outer edge, as in the *Scolytidæ*.—**Serrate ungues**, in *entom.*, ungues or claws having a row of sharp teeth on the lower edge. L., xii. 132. —**7.** In *law*, the burden of an easement, the condition of a tenement which is subject to some right of enjoyment by another than the owner of the tenement, in virtue of his ownership of another tenement. (See *easement*.) In Roman law, a right to use or deal with, in a given and definite manner, a thing belonging to another. As to real estate, it is nearly equivalent or correlative to the easement of the common law, except that it also embraces rights to take the fruits of the servient estate, which in English law are not called *easements*, but *profits à prendre*.—**Affirmative servitude.** See *negative servitude*, below.—**Discontinuous servitude**, in *law*, an easement which consists in the right to perform a series of distinct acts, as a right of way or of common, or the servitude answering thereto, such as cannot be enjoyed but by the intervention of man: distinguished from a *continuous servitude*, which consists in a constant servitude, or in the reservation of some characteristic of the servient tenement, as a right of view or a right to a watercourse.—**Negative servitude**, a servitude or easement which consists in the right merely to restrict the enjoyment of the owner of the servient tenement, as distinguished from one which entitles one to do an act which without the existence of the easement would be a positive wrong to the owner of that tenement. Thus, the right to receive light and air by windows over the land of another is a *negative servitude*, whereas the right to discharge water upon the land of another is an *affirmative servitude*.—**Personal servitude**, a right constituted over a subject in favor of a person, without reference to possession or property.—**Predial servitude**, a right constituted over one subject or tenement enjoyed by the owner of another subject or tenement. Predial servitudes are either *rural* or *urban*, according as they affect land or houses. The usual *rural servitudes* are passage or road, or the right which a person has to pass over another's land; pasture, or the right to send cattle to graze on another's land; fail and divot, or the right to cut turf and peats on another's land; aqueduct, or the right to have a stream of water conveyed through another's land; thirlage, or the right to have other people's corn sent to one's own mill to be ground. *Urban servitudes* consist chiefly in the right to use a party-wall, or a common drain, or to have the rain from one's roof drop on another's land or house; the right to prevent another from building so as to obstruct the windows of one's house; the right of the owner of a flat above to have his flat supported by the flat beneath, etc.=**Syn. 1.** Serfdom, thraldom, vassalage, peonage.—**1** and **3.** *Servitude*, *Slavery*, *Bondage*. These words express involuntary subjection, and are in the order of strength. *Servitude* is the general word, its application to voluntary service being obsolete. *Slavery* emphasizes the completeness and the degradation of the state. *Bondage*, literally the state of being bound, is used chiefly in elevated style or figurative senses: as, *bondage* to appetite; Egyptian *bondage*. *Servitude* is the only one of these words that applies to compulsory and unpaid service required as a legal penalty; the phrase *penal servitude* is very common. See *serf* and *captivity*.

Thus, T. Hills in 1600 writes: "If the quotient be 1½ then it is named *sesquialtera*, if 1⅓ then *sesquitertia*, if 1¼ then *sesquiquarta*, if 1⅕ then *sesquiquinta*, and so foorth infinitely, which names cannot be englished otherwise but thus, once and a halfe, once and a third, once and a quarter, once and a fift, etc."

So a *session* of Parliament comprises the time from its meeting to its prorogation, of which there is in general but one in each year. The *session* of a judicial court is called a *term.* Also applied in the United States to the daily or half-daily periods of work of a school.

In the Established Church of Scotland it is specifically called the *kirk session* (which see, under *kirk*).

They sit in two divisions, the lord president and three ordinary lords forming the first division, and the lord justice-clerk and other three ordinary lords the second division. The first and second divisions form what is called the *inner house.* There are five permanent lords ordinary, each of whom holds a court, the courts of the lords ordinary forming what is called the *outer house.* The junior lord ordinary officiates in the bill-chamber during session. See *bill-chamber.*—**Court of Sessions, Court of General Sessions, Court of Special Sessions,** in the United States, local criminal courts whose jurisdiction does not generally extend to offenses of the highest grades.—**General session of the peace,** in Great Britain, a meeting of the justices held for the purpose of acting judicially for the whole district comprised within their commission. sessional (sesh'on-al), *a.* [< *session* + *-al.*] Relating or belonging to a session or sessions.

sestina (ses-tē'nä), *n.* [It.: see *sestine.*] A poem in fixed form, borrowed from the French, and said to have been invented by the Provençal troubadour Arnaut Daniel (thirteenth century). It consisted originally of six stanzas of six unrimed lines, with a final triplet or half-stanza, also unrimed—all the lines being of the same length. The terminal words of stanzas 2 to 6 were the same as those of stanza 1, but arranged differently; and they were repeated in the triplet or envoy, partly at the end and partly in the middle of the lines. The modern sestina is written on two or three rimes, and the formula for a two-rimed sestina is thus given in the "Vers Français et leur Prosodie" of the best French authority, M. de Gramont: 1, 2, 3, 4, 5, 6; 6, 1, 5, 2, 4, 3; 3, 6, 4, 1, 2, 5; 5, 3, 2, 6, 1, 4; 4, 5, 1, 3, 6, 2; 2, 4, 6, 5, 3, 1; triplet 2, 4, 6 at the end, and 1, 3, 5 at the beginning of the lines. In stanza 1, lines 1, 3, and 4 rime, and 2, 5, and 6 rime. Sestinas were written in Italy by Dante and Petrarch, in Spain and Portugal by Cervantes and Camoëns, and in England by Drummond of Hawthornden (1585–1649). Mr. Swinburne (in "Poems and Ballads," 2d ser.) has achieved a double sestina.

A *sestina* is a poem written neither in rhyme nor blank verse, but in so-called six-line stanzas, each one of which has to take the last word of the stanza preceding it, and twist it about into some new and fantastic meaning.
Athenæum, No. 3141, p. 14.

In the sense 'sink,' as the sun or stars, it is partly of Scand. origin, < Icel. refl. *setask*, set, as the sun, etc. Many uses are highly idiomatic, the verb, like *put*, its nearest equivalent, and *do*, *make*, *get*, etc., having become of almost universal application, and taking its distinctive color from the context.] **I.** *trans.* **1.** To make or cause to rest as on a seat; cause to be put, placed, or seated; place in a sitting, standing, or any natural or normal posture; put: as, to *set* a box on its end or a table on its feet: often with *up* or *down*: as, to *set up* a statue or a flagstaff; to *set down* a burden.

5. In *law:* (*a*) The balancing or countervailing of one debt by another. (*b*) The claim of a debtor to have his debt extinguished in whole or in part by the application of a debt due from his creditor, or from one with whom his creditor is in privity. *Set-off* is that right which exists between two persons each of whom, under an independent contract, owes an ascertained amount to the other, to set off their respective debts, by way of mutual deduction, so that the person to whom the larger debt is due shall recover the residue only after such deduction. (*Kerr.*) *Set-off, counter-claim,* and *recoupment* are terms often used indiscriminately. *Counter-claim* is more appropriate of any cross-demand on which the claimant might if he chose maintain an independent action, and on which, should he establish it as a cause of action, either in such independent action or by way of counter-claim when sued, he would be entitled to an affirmative judgment in his own favor for payment of the claim except so far as his adversary's claim might reduce or extinguish it. This use of the word distinguishes it from such claims as may be set off in favor of a person, which yet would not sustain an action by him, nor any affirmative judgment in his favor. *Recoupment* is appropriate only to designate a cross-demand considered as dependent on the concession of plaintiff's demand, subject to a right to cut down the amount recoverable by virtue of it. In these, which are the strict senses of the words, a *recoupment* only reduces plaintiff's demand, and leaves him to take judgment for what remains after the deduction; a *set-off* extinguishes the smaller of two independent demands and an equal amount of the larger, but may leave the residue of the latter unenforced; a *counter-claim* is one that may be established irrespective of the adversary's success or failure in establishing his claim, and, although subject to be reduced or extinguished by the adversary's success, may otherwise be enforced in the same action.

The root was highly popular for its sanatory properties, mixed with many dishes to make them wholesome. The original species was *Valeriana Pyrenaica*, a plant cultivated in gardens, now naturalized in parts of Great Britain. Latterly the name has been understood of the common officinal valerian, *V. officinalis.*

This astrological association explains the identification by Pythagoras of the number *seven* with the opportune time (*καιρός*), as well as the fact that light was called *seven* by the Pythagoreans. That they termed it "motherless" may be due to the "seven spirits" of the Chaldeans—that is, the planets—being called "fatherless and motherless." The astrological association further explains why the number *seven* has so frequently been suggested by the conception of divine or spiritual influence, and why it was

made the number of intelligence by Philolaus. The common statement that *seven* implies perfection has no further foundation than that the cabalistic meanings of all odd numbers are modes of perfection. One is the first, and was with the Pythagoreans the number of essence (οὐσία). Two involves otherness, and was the number of opinion, "because of its diversity." Three involves mediation, and was the number of beginning, middle, and end. Four naturally suggests a square, and so equity, and was commonly considered the number of justice; but it further carries the suggestion of system, and often has that signification. Five connects itself with the five fingers, used in counting, and thus is an ordinary synecdoche for a small group ("*Five* of you shall chase an hundred"—Lev. xxvi. 8); but the Pythagoreans, for some unknown reason, made it the number of marriage. Six played an important part in the sexagesimal system of the Chaldeans; but its Pythagorean meaning is doubtful. In the Apocalypse 666 is the number of the beast. Eight, being the first cube, would naturally suggest solidity; but according to Dr. Wordsworth it is the dominical or resurrection number. Nine, or three triads, was the number of the great gods of Egypt, and was considered efficient in all magical operations. Ten, for reasons connected with the history of the Pythagorean brotherhood, was considered by them as the great number of power. To eleven no particular significance is attached. Twelve was important in the Chaldean division of the circle, and was the number of the great gods. Thirteen, according to Dr. Mahan, is the number of schism. *Seven* was formerly used generally and vaguely to indicate a large number.

(*d*) In a scale, the seventh tone from the bottom; the leading-tone: solmizated *si*, or, in the tonic sol-fa system, *ti*. The typical interval of the seventh is that between the first and the seventh tones of a major scale, which is acoustically represented by the ratio 8:15. Such a seventh is called *major*. A seventh a half-step shorter is called *minor;* and one two half-steps shorter is called *diminished*. All kinds of sevenths are classed as dissonances, the minor seventh being the most beautiful and the most useful of dissonant intervals. The seventh produced by taking two octaves downward from the sixth harmonic of the given tone is sometimes called the *natural seventh;* it is sometimes used in vocal music, and on instruments, like the violin, whose intonation is not fixed.

4. In *early Eng. law*, a seventh of the rents of the year, or of movables, or both, granted or levied by way of tax.—**Chord of the diminished seventh,** in *music*, a chord of four tones, consisting in its typical form of the seventh, second, fourth, and sixth tones of a minor scale, and made up, therefore, of three minor thirds superposed. It is usually regarded as a chord of the ninth with the root omitted. Several different resolutions of it are possible. Such a chord on a keyboard instrument like the pianoforte is capable of four enharmonic interpretations, so that it is possible to modulate immediately from it into any one of the keys of the keyboard. Thus, in the key of G minor, the typical chord of the diminished seventh is (*a*), which on the keyboard is identical with either (*b*) in the key of B♭ minor, or (*c*) in that of C♯ minor, or (*d*) in that of E minor.

—**Chord of the seventh,** in *music*, a chord of four tones, comprising a root with its third, fifth, and seventh; a seventh chord or sept-chord. The most important seventh-chord is that whose root is the dominant of the key; it is often called the *chord of the dominant seventh*. The resolution of seventh-chords is highly important to the close and satisfactory structure of a composition: usually the seventh itself progresses downward. See *chord*, 4.—**Essential seventh.** See *essential*.

5. In *law*, separable and capable of being treated as separate from, though it may be not wholly independent of, another. So a *several estate* is one which belongs to one person alone, and, although it may in a sense be dependent on others, it is not shared by others during its continuance. (See *estate*, 5.) A *joint and several obligation* is one which so far partakes of both qualities that the creditor may in general treat it in either way, by joining all or suing each one separately.

The sewing-machine is the outgrowth of a very great number of experiments and inventions made in France, England, and the United States, and first culminating practically in the machine invented by Elias Howe. It was developed through the simple type of machine using a needle which passes through the fabric—a type which survives in the Bonnaz or embroidery machine. Then followed the chain-stitch machine and the machines making an interwoven stitch, and lastly came the lock-stitch machines, which are the most approved type at the present day. The various kinds of sewing-machines are all essentially alike, and have been adapted, by the aid of numerous mechanical attachments and devices, to perform almost every kind of sewing that can be done by hand. 'distinction,' < *secare*, divide, cut: see *secant*. A less specific designation for 'sex' was L. *genus* = Gr. γένος, sex, gender: see *gender*, *genus*.] **1.** The character of being either male or female; the anatomical and physiological distinction between male and female, evidenced by the physical character of their generative organs, and the part taken by each in the function of reproduction; gender, with reference to living organisms. Sex is properly predicable only of male or female, those organisms which are neither male nor female being sexless or neuter. But the two sexes are often combined in the same individual, then said to be hermaphrodite or monœcious. Sex runs nearly throughout the animal kingdom, even down to the protozoans, with, however, many exceptions here and there among hermaphrodites. The distinction of sex is probably the most profound and most nearly universal single attribute of organized beings, and among the higher animals at least it is accompanied or marked by some psychological as well as physical characteristics. The essential attribute of the male sex is the generation of spermatozoa, that of the female the generation of ova, accomplished in the one case by a testis or a homologous organ, and in the other by an ovary or a homologous organ. The act of procreation or begetting in the male is the uniting of a spermatozoön to an ovum; the corresponding function in the female is the fecundation of an ovum by a spermatozoön, resulting in conception or impregnation. The organs by which this result is accomplished are very varied in physical character; and various organs which characterize either sex, besides those directly concerned in the reproductive act, are known as secondary sexual characters. See *gender*, *generation*, *reproduction*, and quotation from Buck under *sexuality*, 1.

The figure does not show the colored glass shades which may be interposed behind the horizon-glass and between this and the index-glass *c*, upon which the light from one of the objects is first received, in order to make the contact of the images more distinct. Thus, the hair on a man's face and breast, the antlers of the

deer, the train of the peacock or any other difference in the plumage of a bird between the male and the female, the scent-glands of any male, the claspers of a fish, and many other features are regarded as secondary sexual characters, and are concerned in sexual selection.—**Sexual affinity.** (*a*) The unconscious or instinctive attraction of one sex for the other, as exhibited by the preference or choice of any one individual, rather than of any other, of the opposite sex, as a matter of sexual selection. In man such selection is often called *elective affinity* (after Goethe). (*b*) Such degree of affinity between the sexes of different species as enables these species to interbreed or hybridize.—**Sexual dimorphism,** difference of form or of other zoölogical character in the members of either sex, but not of both sexes, of any animal. Thus, a species of cirripeds which has two kinds of males, or a species of butterflies whose females are of two sorts, exhibits sexual dimorphism. The term properly attaches to the adults of perfectly sexed animals, and not to the many instances of dimorphism among sexless or sexually immature organisms. Thus, the honey-bee is not a case of sexual dimorphism, as there is only one sort of perfect males (the drones) and one of perfect females (the queen), though the hive consists mostly of a third sort of bees (workers or undeveloped females). Sexual dimorphism is common among invertebrates, rare in the higher animals.—**Sexual method,** in *bot.*, same as *sexual system* (*b*).—**Sexual organs,** organs immediately concerned in sexual intercourse or reproduction; the sexual system.—**Sexual reproduction,** reproduction in which both sexes concur; gamogenesis.—**Sexual selection.** See *selection*.—**Sexual system.** (*a*) In *zoöl.* and *anat.*, the reproductive system; the sexual organs, collectively considered. sexuality (sek-ṣū-al′i-ti), *n.* [< *sexual* + *-ity*.] 1. The character of sex; the state of being sexual or sexed or having sex; the distinction between the sexes; sex in the abstract.

It was known even before the time of Linnæus that certain plants produced two kinds of flowers, ordinary open, and minute closed ones; and this fact formerly gave rise to warm controversies about the *sexuality* of plants.
Darwin, Different Forms of Flowers, p. 310.

Sex is a term employed with two significances, which are often confused, but which it is indispensable to distinguish accurately. Originally sex was applied to the organism as a whole, in recognition of the differentiation of the reproductive function. Secondarily, sex, together with the adjectives male and female, has been applied to the essential reproductive elements, ovum and spermatozoon, which it is the function of the sexual organisms (or organs) to pro luce. According to a strict biological definition *sexuality* is the characteristic of the male and female reproductive elements (genoblasts), and sex of the individuals in which the reproductive elements arise. A man has sex, a spermatozoon *sexuality*.
Buck's Handbook of Med. Sciences, VI. 436.

2. Recognition of sexual relations. [Rare.]

You may . . . say again, as I have heard you say ere now, that the popular Christian paradise and hell are but a Pagan Olympus and Tartarus, as grossly material as Mahomet's, without the honest thoroughgoing *sexuality* which, you thought, made his notion logical and consistent. *Kingsley*, Yeast, viii. (*Davies.*)

An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows, though these are not distinguishable from each other, and hence the shadow of such an opaque body received on a plane is always accompanied by a *penumbra*, or partial shadow, the complete shadow being called the *umbra*. A shaft may be sunk vertically, without regard to the dip of the lode, or it may be sunk by an incline following the lode, either closely or approximately, according as its dip is more or less regular. When it is expected that extensive operations will be carried on, the shafts are usually sunk vertically, and connected with the lode at various depths by cross-drifts or levels. When, however, the dip of the lode is pretty uniform and its thickness considerable, all the shafts of the mine may be sunk upon it as inclines. This is the case with the largest mines on Lake Superior. Shafts have various forms, some being round, others oval; but the most common shape is rectangular. In large mines the shaft is usually divided into several compartments, one being used for the pumping-machinery, two or more for hoisting ore, and another for lowering heavy timbers. In the English coal-mines the shafts are mostly circular in section; in Belgium, polygonal; in the anthracite region of Pennsylvania the winding shafts are always square or rectangular, and there the largest shafts have a length of from 44 to 52 feet, and a width of 10 or 12.

2. Am (is, are, was, etc.) to (do something specified by the infinitive): forming verb-phrases having the value of future and conditional tenses, and usually (and properly enough) called such. (*a*) *Shall* is used in direct assertion to form the first persons singular and plural of the future and future-perfect tenses, the second and third persons in these tenses being formed by *will*. In this connection *shall* simply foretells or declares what is about to take place: as, I *shall* go to town to-morrow; we *shall* spend the summer in Europe. The future tense of the verb *go* thus becomes

I *shall*	go;	We *shall*	go.
Thou *wilt*		You *will*	
He *will*		They *will*	

"The use of *shall* instead of *will* in the first person is probably due to the fact that the act thus announced as about to take place ensues from the duty or obligation arising outwardly but contemplated inwardly as proper, and consequently as now about to take place in virtue of a tacit act of the speaker's will. Should the will or resolution of the speaker intervene, or be prominent in his mind, then *will* would be the proper word to express the futurity of the act: thus, 'I *will* go' means 'I am determined to go, 'I have made up my mind to go.' 'I *shall* go home this evening' announces a future event as settled by consideration outside of the speaker's self; 'I *will* go home this evening' announces a future event having both its cause and its accomplishment in the speaker's own mind." (*Dr. Beard.*) In indirect assertion *shall* may express mere futurity in the second and third persons: as, he says that he *shall* go; he said that he *should* go: in these sentences "he" refers to one and the same person, the one who "says." If it referred to any other person, *will* would be used and not *shall*.

That woman had to water her soup with her furtive tears, to sit of nights behind hearts and spades, and brood over her crushed hopes. If I contemplate that wretched old Niobe much longer, I *shall* begin to pity her.
Thackeray, Philip, II. xiii.

T. Hughes, Tom Brown at Rugby, ii. 8.

I *shall* stay and sleep in the church.
George Eliot, Romola, xiv.

(*b*) In the second and third persons *shall* implies authority or control on the part of the speaker, and is used to express (1) promise: as, you *shall* receive your wages; (2) command: as, thou *shalt* not steal; (3) determination: as, you *shall* go.

My glass *shall* not persuade me I am old,
So long as youth and thou are of one date.

(4) Certainty or inevitability as regards the future.

And if I die, no man *shall* pity me [that is, it is certain no man will pity me]. *Shak.*, Rich. III., v. 3. 201.

(*c*) Interrogatively, *shall* or *will* is used according as the one or the other would be used in reply, and accordingly '*shall* I go?' '*shall* we go?' '*shall* he go?' '*shall* they go?' ask for direction, or refer the matter to the determination of the person asked—that is, '*shall* I go?' anticipates the answer 'you *shall* go.'

Pan. But will you tell me? *Shall* I marry?
Troud. Perhaps. *Urquhart*, tr. of Rabelais, iii. 36.

I was employ'd in passing to and fro,
About relieving of the sentinels:
Then how or which way *should* they first break in?
Shak., 1 Hen. VI., ii. 1. 71.

(*d*) After conditionals, such as *if* or *whether*, and after verbs expressing condition or supposition, *shall* expresses simple futurity in all persons, the idea of restraint or necessity involved originally in the word *shall* being excluded by the context—thus:

If { I (or we) *shall* / Thou *shalt*, or you *shall* / He (or they) *shall* } say.

If then we *shall* [that is, are to] shake off our slavish yoke,
Imp out our drooping country's broken wing,
Away with me! *Shak.*, Rich. II., ii. 2. 291.

Southey, Wesley, I. 309, note (quoted in F. Hall's False [Philol., p. 49).

In the older writers, as for instance in the authorized version of the Bible, *shall* was used of all three persons.

Shall, like other auxiliaries, is often used with an ellipsis of the following infinitive.

Chaucer, Nun's Priest's Tale, l. 274.

You have not pushed these diseased neither with side nor shoulder, but have rather strewed their way into the Palace with flowers, as you *should*.
Bunyan, Pilgrim's Progress, ii.

3. The past tense *should*, besides the uses in which it is merely the preterit of *shall*, as above, has acquired some peculiar uses of its own. In some of these uses *should* represents the past subjunctive, not the past indicative. It is not used to express simple past futurity, except in indirect speech: as, I said I *should* [was to] go; I arranged that he *should* [was to] go. *Should* is often used to give a modest or diffident tone to a statement, or to soften a statement from motives of delicacy or politeness: thus, 'I *should* not like to say how many there are' is much the same as 'I hardly like,' or 'I do not like,' etc. Similarly, 'it *should* seem' is often nearly the same as 'it seems.'

He is no suitor then? So it *should* seem.
B. Jonson.

Should was formerly sometimes used where we should now use *might*.

The scribis and Pharisees aspieden hym that thei *schulden* fynde cause whereof thei *schulden* accuse hym.
Wyclif, Luke vi. 7.

The distinctions in the uses of *shall* and *will* and of *should* and *would* are often so subtle, and depend so much upon the context or upon subjective conditions, that they are frequently missed by inaccurate speakers and writers, and often even by writers of the highest rank. There is a tendency in colloquial English to the exclusive use of *will* and (except after a conditional word) *would*. See *will*[1].

Cæsar *should* [would] be a beast without a heart
If he should stay at home to-day for fear.
Shak., J. C., ii. 2. 42.

★**shark**[1] (shärk), *n.* [Not found in ME. (the ME. name therefor being *hound-fish*): usually derived < L. *carcharus*, < Gr. καρχαρίας, a kind of shark, so called from its sharp teeth, < κάρχαρος, jagged (of teeth); cf. καρκίνος, a crab; Skt. *karkata*, a crab, *karkara*, hard. But the requisite OF. forms intermediate between E. *shark* and L. *carcharus* are not found, and it is not certain that the name was orig. applied to the fish; it may have been first used of a greedy man (see *shark*[2]).] A selachian of the subclass *Plagiostomi*, of an elongate form, with the pectoral fins moderately developed, the branchial apertures lateral, and the mouth inferior (rarely terminal). Over 150 species are known as inhabitants of the modern seas, and sharks formed a very important or even predominant contingent to the faunæ of early epochs. The internal differences manifested by species having a considerable resemblance externally are so great as to have led some naturalists to propose for them three distinct orders, which have been named *Anarthri, Proarthri*, and *Opistharthri*. Most living sharks belong to the first order and represent therein 15 families, while of the *Proarthri* only one family with 4 species is known, and of the *Opistharthri* two families with 6 or 7 species. Most sharks are carnivorous, and some of them eminently so; their dentition corresponds to this character, the teeth being often compressed, with trenchant and frequently serrated edges, arranged in many rows, and folded back on the jaws, leaving only the outermost erect for action. These rows of teeth successively come into functional position. In others, however, the teeth are flattish and not erectile. In a few, also, which attain a large size, the teeth are extremely small, and the animal feeds upon very small animals, being not truly carnivorous. The skin is generally covered with small scales or plates firmly adherent to the skin and overlapping, forming shagreen. (See cut under *scale*[1].) But various deviations are manifested in different forms, and in one, *Echinorhinidæ*, the surface is mostly naked, only some thorn-like plates being developed. Sharks inhabit for the most part tropical and warm waters; the larger ones live in the open sea, but a few species extend into high north and south latitudes. The largest shark is *Rhinodon typicus*, the whale-shark, said to attain a length of over 50 feet. Next in size is the great basking-shark, *Cetorhinus maximus*, which is reported occasionally to reach a length of 40 feet. (See *Cetorhinus*, and cut under *basking-shark*.) Another large species is *Carcharodon carcharias*, among those known as *man-eaters*. The ordinary carnivorous sharks belong to the family *Galeorhinidæ* or *Carchariidæ*, as the common blue sharks. The topes also belong to this family. (See cut under *Galeorhinus*.) The hammer-headed sharks belong to the family *Sphyrnidæ* or *Zygænidæ*. Fox-sharks or threshers are *Alopeciidæ*. The porbeagles or mackerel-sharks are *Lamnidæ*. (See cut under *mackerel-shark*.) Gray sharks or cow-sharks are *Notidanidæ*. (See cut under *Hexanchus*.) shear[1] (shēr), *n.* [< *shear*[1], *v.* Cf. *share*[1].] **1.** A shearing or clipping: used in stating the age of sheep: as, a sheep of one *shear*, a two-*shear* sheep (that is, a sheep one or two years old), in allusion to the yearly shearing.—**2.** A barbed fish-spear with several prongs. *E. H. Knight.*—**3.** A strain consisting of a compression in one direction with an elongation in the same ratio in a direction perpendicular to the first. Thus, in fig. 1, suppose a body in which the axis AC is compressed to *ac*. Suppose there is an axis of equal elongation, upon which take BD equal to *ac*, so that after elongation it will be brought to *bd*, equal to AC. Then, all planes perpendicular to the plane of the diagram and parallel either to AB or to AD will remain undistorted, being simply rotated into positions parallel to *ab* or *ad*. If the body while undergoing strain be so rotated that *a* and *b* remain in coincidence with A and B (see fig. 2), the shear will be seen to be an advance of all planes parallel to a fixed plane in parallel lines in those planes by amounts proportional to their distances from the fixed plane. A shear is often called a *simple shear*, meaning a shear uncompounded with any other strain. Any simple strain may be resolved into a shear, a positive or negative elongation perpendicular to the shear, and a positive or negative expansion.

shears: see *shear*[2].] **1.** A cutting- or clipping-instrument consisting of two pivoted blades with beveled edges facing each other, such as is used for cutting cloth, or of a single piece of steel bent round until the blades meet, the elasticity of the back causing the blades to spring open when the pressure used in cutting has ceased. The latter is the kind used by farriers, sheep-shearers, weavers, etc. Shears of the first kind differ from scissors chiefly in being larger. The density and homogeneousness of the steel are increased by this process, and it is generally admitted that a better result is attained by hammering than by rolling. See *steel*.

shear-structure (shēr'struk″tūr), *n.* In *geol.*, a structure superinduced in rocks by shearing; a structure varying from lamellar to schistose, somewhat resembling the so-called "fluxion-structure" often seen in volcanic rocks, but produced by the flowing, not of molten, but of solid material, as one of the consequences of the immense strain by which the upheaval or plication of large masses of rock has been accompanied.

sheartail (shēr'tāl), *n.* **1.** A humming-bird of the genus *Thaumastura*, having a very long forficate tail, like a pair of shears, as *T. cora*, *T. henicura*, etc. In the cora hummer (to which the

genus *Thaumastura* is now usually restricted, the others formerly referred to it being placed in *Doricha*) the structure of the tail is peculiar; for the middle pair of feathers is so short as to be almost hidden by the coverts, while the next pair is suddenly and extremely lengthened, and then the other three pairs rapidly shorten from within outward. In *Doricha* (*D. henicura*, etc.) the shape of the tail is simply forficate, as the feathers lengthen from the shortest middle pair to the longest outer pair, like a

Sheartail (*Thaumastura cora*).

tern's. In all these cases the long feathers are very narrow and linear, or of about uniform width to their ends. The peculiar formation is confined to the males. *T. cora* has the tail (in the male) about 4 inches long, though the length of the bird is scarcely 6 inches; it is golden-green above and mostly white below, with a metallic crimson gorget reflecting blue in some lights, and the tail black and white. The female is 3½ inches long, the tail being 1½. It inhabits Peru. Five species of *Doricha* range from the Bahamas and parts of Mexico into Central America.

2. A sea-swallow or tern: from the long forked tail. See cut under *roseate*. [Prov. Eng.]—

A sea-bird of the petrel family, *Procellariidæ*, and section *Puffineæ*, having a long and comparatively slender, much-hooked bill, short nasal tubes obliquely truncate and with a thick nasal septum, long pointed wings, short tail, and close oily plumage. There are many species, mostly of the genus *Puffinus*, found on all seas, where they fly very low over the water, seeming to shear, shave, or graze it with their long blade-like wings (whence the name). Some of them are known as *hags* or *hagdens*. Three of the commonest are the greater shearwater, *P. major*; the Manx shearwater, *P. anglorum*; and the sooty shearwater, *P. fuliginosus*, all of the North Atlantic. They nest in holes by the seaside, and the female lays one white egg. See cut under *hagden*.

The flesh is edible, the fat is used in dressing leather, and the sound yields a kind of gelatin. It is of elongate form with a small dorsal, no adipose fin, a long anal, and a distinct caudal with a roundish margin: there are six barbels. It takes the place in Europe of the common catfish of North America, and belongs to the same family, but to a different subfamily. (See cut under *Siluridæ*.) With a qualifying term, *sheat-fish* extends to some related families. See phrases following.

Such sheaths may be cylindrical, as when investing a nerve or blood-vessel and extending in its course; or flat and expansive, as when binding down muscles. A layer of deep fascia commonly forms a continuous sheath of all the muscles of a limb, as notably in the case of the fascia lata, which envelops the thigh, and is made tense by a special muscle (the tensor fasciæ latæ). A ruminant mammal of the family *Bovidæ*, subfamily *Ovinæ*, and genus *Ovis*; specifically, *Ovis aries*, domesticated in many varieties, and one of the animals most useful to man. The male is a ram, the female a ewe, and the young a lamb; the flesh of the adult is mutton; of the young, lamb; the coat or fleece is wool, a principal material of warm clothing; the prepared hide is sheepskin, used for many purposes; the entrails furnish sausage-cases, and are also dried and twisted into strings for musical instruments ("catgut"); the prepared fat makes tallow or suet; and the twisted horns of the ram are used in the manufacture of various utensils. The milk of the ewe is thicker than that of the cow, yielding a relatively greater quantity of butter and cheese. The sheep is one of the most harmless and timid of animals. The artificial breeds of *O. aries* are numerous; it is not known from what wild stock or stocks they are descended. The mouflon is a probable ancestor of some at least of the domestic varieties, especially those with short tail and crescentic horns. The principal English varieties of the sheep are the large Leicester, the Cotswold, the Southdown, the Cheviot, and the black-faced breeds. The Leicester comes early to maturity, attains a large size, has a fine full form, and carries more mutton, though not of finest quality, in the same apparent dimensions than any other; the wool is not so long as in some other breeds, but is considerably finer. The Cotswolds have been improved by crossing with Leicesters; their wool is fine, and their mutton fine-grained and full-sized. Southdowns have short, close, and curled wool, and their mutton is highly valued for its flavor; they attain a large size. All these require a good climate and rich pasture. The Cheviot is much hardier, and is well adapted for the green, grassy hills of Highland districts; the wool is short, thick, and fine. The Cheviot possesses good fattening qualities, and yields excellent mutton. The black-faced is hardiest of all, and adapted for wild heathery hills and moors; its wool is long and coarse, but its mutton is the very finest. The Welsh resembles the black-faced, but is less hardy; its mutton is delicious, but its fleece weighs only about 2 pounds. The foreign breeds of sheep are numerous, some of the more remarkable being (*a*) the broad-tailed sheep, common in Asia and Egypt, and remarkable for its large heavy tail; (*b*) the Iceland sheep, having three, four, or five horns; (*c*) the fat-rumped sheep of Tatary, with an accumulation of fat on the rump, which, falling down in two great masses behind, often entirely conceals the tail; (*d*) the Astrakhan or Bucharian sheep, with the wool twisted in spiral curls, and of very fine quality; (*e*) the Wallachian or Cretan sheep, with very large, long, and spiral horns, those of the male being upright, and those of the female at right angles with the head. All the wild species of *Ovis* have the book-name *sheep*, and also particular designations. (See *argali, bighorn, mouflon, musimon.*) The best-known form in the new world is the Rocky Mountain sheep, or bighorn, *O. montana*. Certain *Ovinæ* of modern genera detached from *Ovis* are called *sheep* with a qualifying term, as the aoudad, or Barbary sheep. See cuts under *aoudad, bighorn, merino, Ovis, quadricorn*, and *Ruminantia*.

2. In *zoöl.*, a hard outer case or covering; a crust; a test; a lorica; a carapace; an indurated (osseous, cartilaginous, cuticular, chitinous, calcareous, silicious, etc.) integument or part of integument. (*e*) In *Mollusca*, the test of any mollusk; the valve or valves of a shell-fish; the chitinized or calcified product of the mantle; a conch. A shell in one, two, or several pieces is so highly characteristic of mollusks that these animals are commonly called *shell-fish* collectively, and many of them are grouped as *Testacea*, *Conchifera*, etc. In some mollusks, as dibranchiate cephalopods, the shell is internal, constituting the pen or cuttle (see *calamary*); in others there is no shell. The shell is secreted chiefly by a mantle or folds of the mantle which are developed around the soft parts, and is usually composed of carbonate of lime. It is generally univalve and spiral, as in most gastropods. In chitons there are eight valves imbricated in a longitudinal series, bound together by a marginal band. In bivalves two shells are developed from and cover the sides of the animal, right and left. (See cuts under *bivalve*.) Some mollusks otherwise bivalve have accessory valves. (*f*) In *Brachiopoda* there are two valves, but one covers the back and the other the abdominal region, so that the valves are dorsal and ventral. These shells are sometimes composed chiefly of phosphate of lime, as in lingulas. (*j*) In *Vermes*, the tube or case of a tubicolous worm, when hard, thick, or rigid, like a mollusk's shell: as, the *shell* of a serpula. (*k*) In some *Protozoa*, a silicious or calcareous test or lorica of any kind. Such shells are present under numberless modifications, often beautifully shaped and highly complicated, perforated, camerated, etc., as in foraminifers, radiolarians, sun-animalcules, many infusorians, etc.

sheriff[1] (sher′if), *n.* [Also sometimes in the restored or explanatory form *shire-reeve;* also sometimes contracted *shrieve*, early mod. E. *sheriffe, schereff, shireeve*, etc., < ME. *shereve, scherreve, shireve, shirreve, schyreve, schirreve, syrreve* (pl. *shireves, schirreves, shrives*), < AS. *scīr-gerēfa*, 'shire-reeve,' < *scire*, shire, + *gerēfa*, a reeve, officer: see *shire*[1] and *reeve*[1]. Cf. *townreeve, portreeve*.] The chief civil officer charged with administering justice within a county, under direction of the courts, or of the crown or other executive head of the state, and usually having also some incidental judicial functions. (*a*) In England, the chief officer of the crown in every county or shire, who does all the sovereign's business in the county, the crown by letters patent committing the custody of the county to him alone. Sheriffs are appointed by the crown upon presentation of the judges in a manner partly regulated by law and partly by custom (see *pricking*); the citizens of London, however, have the right of electing the sheriffs for the city of London and the county of Middlesex. Those appointed are bound under a penalty to serve the office, except in specified cases of exemption or disability. As keeper of the queen's peace, the sheriff is the first man in the county, and superior in rank to any nobleman therein during his office, which he holds for a year. He is specially intrusted with the execution of the laws and the preservation of the peace, and for this purpose he has at his disposal the whole civil force of the county—in old legal phraseology, the *posse comitatus*. He has also some judicial functions, less extensive now than formerly. The most ordinary of his functions, which he always executes by a deputy called *under-sheriff*, consists in the execution of writs. The sheriff performs in person such duties only as are either purely honorary, such as attendance upon the judges on circuit, or of some dignity and public importance, such as the presiding over elections and the holding of county meetings, which he may call at any time.

(*b*) In Scotland, the chief local judge of a county. There are two grades of sheriffs, the chief or superior sheriffs and the sheriffs-substitute (besides the lord lieutenant of the county, who has the honorary title of *sheriff-principal*), both being appointed by the crown. The chief sheriff, usually called simply the *sheriff*, may have more than one substitute under him, and the discharge of the greater part of the duties of the office now practically rests with the sheriffs-substitute, the sheriff being (except in one or two cases) a practising advocate in Edinburgh, while the sheriff-substitute is prohibited from taking other employment, and must reside within his county. The civil jurisdiction of the sheriff extends to all personal actions on contract, bond, or obligation without limit, actions for rent, possessory actions, etc., in which cases there is an appeal from the decision of the sheriff-substitute to the sheriff, and from him to the Court of Session. He has also a summary jurisdiction in small-debt cases where the value is not more than £12. In criminal cases the sheriff has jurisdiction in all offenses the punishment for which is not more than two years' imprisonment. He has also jurisdiction in bankruptcy cases to any amount. (*c*) In the United States, except in New Hampshire and Rhode Island, sheriffs are elected by popular vote, the qualification being that the sheriff must be a man, of age, a citizen of the United States and of the State, and a resident in the county; usually he can hold no other office, and is not eligible for reelection until after the lapse of a limited period. In all the States there are deputy sheriffs, who are agents and servants of the sheriff. In New York and some other States there is, as in England, an under-sheriff, who acts in place of his chief in the latter's absence, etc. The principal duties of the sheriff are to preserve peace and order throughout the county, to attend the courts as the administrative officer of the law, to guard prisoners and juries, to serve the process and execute the judgments of the courts, and to preside at inquisitions and assessments of damages on default.—**High sheriff**, the sheriff as distinguished from the under-sheriff and other deputies.—**Joint sheriff**, two persons jointly appointed sheriff, or one of such persons.—**Sheriff of Middlesex case**, a decision in 1840, noted in English constitutional history, on the relative powers of Parliament, to imprison for contempt and the courts to discharge on habeas corpus.—**Sheriff's jury**. See *jury*.—**Sheriff turn**, in *early Eng. law*, the periodical court or session held by a sheriff successively in the various hundreds of his county, at which the freeholders were bound to appear as a part of their service.—**Statute of sheriffs**. 'sect.'] A member of that division of the Mohammedans which maintains that Ali, first cousin of Mohammed and husband of his daughter Fatima, was the first legitimate imam or successor of the Prophet, and rejects the first three califs of the Sunnis (the other great division) as usurpers. The Shiahs "are also called the Imamiyahs, because they believe the Muslim religion consists in the true knowledge of the Imam or rightful leaders of the faithful" (*Hughes*, Dict. Islam). (See *imam* and *calif.*) They claim to be the orthodox Mohammedans, but are treated by the Sunnis as heretics. The Shiahs comprise nearly the whole Persian nation, and are also found in Oudh, a province of British India; but the Mohammedans of the other parts of India are for the most part Sunnis. When I was at the College School, Gloucester, some twenty years ago, almost every boy wore an oak-apple (some of which were even gilded) in his buttonhole on the 29th of May. Those who had not this decoration were called sotto voce in the school-room and yelled after in the grove, *Shig-shag!* this opprobrious epithet, when uttered at close quarters, being generally accompanied by three pinches. No boy who cared for his peace of mind and wished to save himself some "nips and tweaks" would appear in school without at least an oak-leaf in honour of the day.

encumbrance than a safeguard, and by savage peoples to the present day. Specifically, as distinguished from the buckler, a large implement of the sort, covering the body at least on one side, and carried on the

arm, which passed through rings or straps on its inner side, or hung around the neck by a guige or strap. The shield of the middle ages was in the tenth century very long, pointed at the bottom and rounded at the top. (See *kite-shield*, below.) At later periods it was changed in size and shape, becoming shorter and smaller, at first triangular and afterward broad, short, and pointed. (See *écu*, and *tilting-shield* (below).) In the fifteenth century the shield proper was relegated to the just, and soon after disappeared altogether. (For the hand-shield used for parrying blows, see *buckler*; for the large shield used in sieges, see *pavise*.) Shields of barbarous peoples differ greatly in size, shape, and material: thus, those of the peoples of South Africa, made of hide, are nearly six feet long; those of the Mussulman nations are much smaller and usually round. See also cuts under *buckler*, *enarme*, *hoplite*, *orle*, *pavise*, *pelta*, *rondache*, and *scutum*.

gone far toward rendering this restricted application of the word of little value. Owing to increase of size, and especially increase in length, some sailing vessels now have four masts, and this rig is said to have certain advantages. Until recent times wood, such as oak, pine, etc., was the material of which all ships were constructed, but it is being rapidly superseded by iron and steel; and in Great Britain, which is the chief ship-building country in the world, the tonnage of the wooden vessels constructed is small compared with that of vessels built of iron. The first iron vessel classed at Lloyd's was built at Liverpool in 1838, but iron barges and small vessels had been constructed long before this. Four-masted vessels which are square-rigged on all four masts are called *four-masted ships;* those which have fore-and-aft sails on the after mast are called *four-masted barks.* See also cuts under *beam*, 3, *body-plan*, *counter*, *forebody*, *forecastle*, *keel*, *poop*, and *prow*.

shire[1] (shēr or shīr; in the United Kingdom now usually shīr, except in composition), *n.* [Early mod. E. also *shyre, shiere*; < ME. *shire, shyre, schire, schyre*, < AS. *scīr*, also *scire*, office, stewardship, business, administration, district, county, shire, diocese, parish; cognate with OHG. *scira*, business, employment. The word has long been confused with AS. *sceran, scieran*, divide, shear, and its derivates, *scierian*, allot, assign, *scearu*, share, etc., and this has appar. affected its use and its pronunciation. The normal mod. pronunciation would be *shīr*.] 1†. A district.

It may seem not impossible that the original name of the subdivision immediately above the township was scir or *shire*, a term of various application. The city of York was divided into seven *shires*, and the use of the word in northern Northumbria, the present Lowlands of Scotland, a territory which was peopled by Saxons and little disturbed by Danish aggression, points to the same conclusion.
Stubbs, Const. Hist. Eng., I. 112.

An exact diuision thereof [Palestine] into twelve *shires* or shares. *Purchas*, Pilgrimage, p. 108.

In the earlier use of the word, *shire* had simply answered to division. The town of York was parted into seven such *shires*. *J. R. Green*, Conquest of England, p. 230.

2. Originally, a division of the kingdom of England under the jurisdiction of an ealdorman, whose authority was intrusted to the sheriff ('shire-reeve'), on whom the government ultimately devolved; also, in Anglo-Saxon use, in general, a district, province, diocese, or parish; in later and present use, one of the larger divisions into which Great Britain is parted out for political and administrative purposes; a county. Some smaller districts in the north of England retain the provincial appellation of *shire*, as Richmondshire, in the North Riding of Yorkshire, and Hallamshire, or the manor of Hallam, in the West Riding, which is nearly coextensive with the parish of Sheffield. See *knight of the shire*, under *knight*.

Of maystres hadde he moo than thries ten,
That were of lawe expert and curious; . . .
An able for to helpen al a *shire*
In any caas that mighte falle or happe.
Chaucer, Gen. Prol. to C. T. (ed. Morris), l. 584.

The foole expects th' ensuing year
To be elect high sherif of all the *sheire*.
Times' Whistle (E. E. T. S.), p. 46.

The name *scir* [AS. *scīre*] or *shire*, which marks the division immediately superior to the hundred, merely means a subdivision or share of a larger whole, and was early used in connexion with an official name to designate the territorial sphere appointed to the particular magistracy denoted by that name. So the diocese was the bishop's *scire*, and the stewardship of the unjust steward is called in the Anglo Saxon translation of the Gospel his *græfscire*. We have seen that the original territorial hundreds may have been smaller *shires*. The historical *shires* or counties owe their origin to different causes.
Stubbs, Const. Hist., § 48.

See the quotation under *shire-day*.—**The shires**, a belt of English counties running in a northeast direction from Devonshire and Hampshire, the names of which terminate in *shire*. Cf. *folkmoot, witena-gemot.*] Formerly, in England, a court or assembly of the county held periodically by the sheriff along with the bishop of the diocese, and with the ealdorman in shires that had ealdormen.

The presence of the ealdorman and the bishop, who legally sat with him [the sheriff] in the *shire-moot*, and whose presence recalled the folk-moot from which it sprang, would necessarily be rare and irregular, while the reeve was bound to attend; and the result of this is seen in the way in which the *shire-moot* soon became known simply as the sheriff's court.
J. R. Green, Conquest of England, p. 230.

The *shiremoot*, like the hundredmoot, was competent to declare folkright in every suit, but its relation to the lower court was not, properly speaking, an appellate jurisdiction. Its function was to secure to the suitor the right which he had failed to obtain in the hundred.
Stubbs, Const. Hist., § 50.

He then proceeds to state, apparently as a corollary of what may be called his *bloody-shirt* principle, that our Revolution was not popular with what he terms the inferior classes. . . . But most assuredly the Americans did not want a visible signal to push them on; and he who should have displayed a *bloody shirt* for that purpose would have been followed by the contempt of the spectators, and saluted with stones by every idle boy in the streets.

Erethismic shock, in *pathol.* See *erethismic*.—**Shock of the glottis.** See *glottis*.—**Syn.** *Shock*, *Collision*, *Concussion*, *Jolt*. A *shock* is a violent shaking, and may be produced by a *collision*, a heavy *jolt*, or otherwise; it may be of the nature of a *concussion*. The word is more often used of the effect than of the action: as, the *shock* of battle, a *shock* of electricity, the *shock* from the sudden announcement of bad news. A *collision* is the dashing of a moving body upon a body moving or still: as, a railroad *collision*; *collision* of steamships. *Concussion* is a shaking together; hence the word is especially applicable where that which is shaken has, or may be thought of as having, parts: as, *concussion* of the air or of the brain. *Collision* implies the solidity of the colliding objects: as, the *collision* of two cannon-balls in the air. A *jolt* is a shaking by a single abrupt jerking motion upward or downward or both, as by a springless wagon on a rough road. *Shock* is used figuratively; we speak sometimes of the *collision* of ideas or of minds; *concussion* and *jolt* are only literal.

shogun (shō'gön'), *n.* [Jap. (= Chin. *tsiang kiun*, handle (or lead) the army), < *sho* (= Chin. *tsiang*), take, hold, have charge of, or lead in fight, + *gun* (= Chin. *kiun*, *kun*), army.] General: the title of the commander-in-chief or captain-general of the Japanese army during the continuance of the feudal system in that country. More fully called *tai shogun* ('great general'), or *sei-i tai-shogun*, 'barbarian-subduing-great-general'—the earlier wars of the Japanese (when this form of the title was first used) having been waged against the 'barbarians' or aboriginal inhabitants of the country. The office was made hereditary in the Minamoto family in 1192, when the title was bestowed on a famous warrior and hero named Yoritomo, and continued in that family or some branch of it until 1868, when it was abolished, and the feudal system virtually came to an end. From the first a large share of the governing power naturally devolved on the shogun as the chief vassal of the mikado. This power was gradually extended by the encroachments of successive shoguns, especially of Iyeyasu, founder in 1603 of the Tokugawa line, and in course of time the shoguns became the virtual rulers of the country—always, however, acknowledging the supremacy of the mikado, and professing to act in his name. This state of things has given rise to the common but erroneous opinion and assertion that Japan had two emperors—"a spiritual emperor" (the mikado), living in Kioto, and "a temporal emperor" (the shogun), who held court in Yedo (now called Tokio). In the troubles which arose subsequent to 1858 in connection with the ratification and enforcement of the treaties which the shogunate had made with foreign nations, establishing trade relations, etc., many of the daimios, tired of the domination of the shogun and disapproving of the treaties, sided with the emperor; this led in 1867 to the resignation of the shogun of the time, and in the following year the office was abolished, the reigning mikado undertaking to govern the country in person. 14. Not prolonged in utterance; less in duration than times or sounds called long: said of times, vowels, and syllables. Specifically—(*a*) In *pros.*, not exceeding in duration the unit of time (*mora, semeion*), or so regarded. The ordinary short vowel of ancient pronunciation varied somewhat in actual duration, but seems to have usually been uttered as rapidly as was consistent with full distinctness of sound. (See *long*[1], *n.*, 2.) Sometimes in metrical or rhythmical treatment a short syllable occupied less time in utterance than a normal short (was a *diminished short*, βραχεῖα μεμειωμένη), and in what is commonly known as *elision* the first of two vowel-sounds, although still audible, was shortened to such a degree as to be entirely disregarded in metrical composition. A syllable containing a short vowel was regarded as short unless the vowel stood in *position* (which see). Rhythmical or musical composition occasionally allowed itself the liberty of treating a prosodic short as a long (an *augmented short*, βραχεῖα ηὐξημένη), and vice versa. In metrical composition a short syllable usually did not take the ictus; hence, in modern versification, an unaccented syllable, whatever its duration, is said to be *short*. A short time, vowel, or syllable is marked by a curved line written independently or above the vowel: thus, ⏑, *ă*.

I. *n.* A method of rapid writing with brief characters, different from longhand, and capable of being so contracted and combined that the hand can keep pace with speech; stenography; brachygraphy; tachygraphy; phonography (which see). Shorthand was used by the Greeks and Romans, but all knowledge of the art was lost from the tenth to the sixteenth century, when modern shorthand had its inception in the treatises of Dr. Timothy Bright (1588) and Peter Bales (1590), in which arbitrary signs were used to represent each word. The first system of any practical importance was that of John Willis (1602), which was based on the common alphabet with the addition of arbitrary signs. Among Willis's imitators were T. Shelton (1626), Jeremiah Rich (1642), William Mason (1672), Thomas Gurney (1750), John Byrom (1767), William Mavor (1779), and Samuel Taylor (1786). Taylor's was considered the best of the a-b-c systems, and was largely used until Isaac Pitman (1837) invented phonography, which, as variously modified by its originator and others, has been more widely adopted than any other method. In its improved form (ninth edition 1852, tenth edition 1857) it is the system best known in the United States. It has been modified by Benn Pitman (brother of Isaac), A. J. Graham, J. E. Munson, Osgoodby, Burnz, and others. In this system speeds ranging from 200 to 250 words per minute, for ten minutes' continuous writing from new matter with accurate transcripts, have been attained. It has been adapted to the French, German, Spanish, and other languages.

Shot-guns are usually either single-barreled or double-barreled; rarely a third barrel is added; sometimes one of the barrels is rifled (see the quotation). Besides being smooth-bored, a shot-gun differs from any form of rifle in having no hind-sight and a simple pin as fore-sight. Shot-guns are also distinguished as *muzzle-loaders* and *breech-loaders*; the former are little used now. Though the bore is always smooth, it is often contracted toward the muzzle to concentrate the discharge. (See *choke-bore*.) The standard shot-gun now most used by sportsmen is the double-barreled breech-loader, of 7 to 10 pounds weight, about 30 inches length of barrel, length and drop of stock fitting the shooter, often with pistol-grip, caliber usually 10, 12, or 14, and taking corresponding sizes of paper or metal shot-cartridges (see *shell*) with center-fire primers or percussion-caps and an automatic ejector; such as have the cock or hammer concealed in the mechanism of the lock are specified as *hammerless*. The special makes are numberless, but decided variations from the standard pattern are rare. Shot-guns are seldom fitted with hair-triggers, but usually with rebounding locks, in which the hammer flies back to half-cock on delivering the blow on the plunger. A special form of shot-gun, used by naturalists, is described under *cane-gun*.

The human shoulder-blade is somewhat peculiar in shape, and some of its parts are named in terms not applicable or seldom applied to scapulæ in general. It is a compound bone, including a coracoid as a mere process, and develops from seven centers of ossification, two of which are coracoid. It is commonly said to have two *surfaces*, three *borders*, and three *angles*. Of these, the ventral surface, which lies upon the ribs, is the *venter*; the other surface is the *dorsum*. This latter is unequally divided into two parts by the development of a high ridge, the *spine*, extended into a stout process, the *acromion*. The flat part above the spine is the *supraspinous fossa*; that below the spine, the *infraspinous fossa*; the venter is also called the *subscapular fossa*. These three fossæ indicate the primitively prismatic and rod-like character of the bone; and they correspond respectively to the *prescapular*, *postscapular*, and *subscapular surfaces* of a more general nomenclature. The spine being actually in the axis of the scapula, it follows that the long *vertebral border* (a_1 to a_2 in the figure) is the proximal end of the bone. The *glenoid fossa* is at the other end of the bone, at its confluence with the coracoid. The *axillary border* is one edge of the primitive prism; the *superior border* is another; and the third is along the free edge of the spine. The *suprascapular notch* in the superior border (converted into a foramen by a ligament) denotes the passage there of the vessels and nerve called by the same name. The peculiarities of the human scapula result mainly from its extensive growth downward to the inferior angle (a_2), with consequent lengthening of the axillary border and of the so-called vertebral "border," and from great development of the spine and acromion. This bone, as usual in the higher vertebrates, has two articulations—with the clavicle and with the humerus; excepting the acromioclavicular articulation, it is attached to the trunk solely by muscles, of which sixteen (sometimes seventeen) arise from or are inserted into the bone. (Compare the shape of the rabbit's shoulder-blade, figured under *metacromion*, and of a bird's, under *scapula*.) See also cut under *shoulder*.

dle for the reception of the bobbin or pirn on which the weft is wound. The weft unwinds from this bobbin as the shuttle runs from one side of the web to the other. It is driven across by a smart blow from a pin called a *picker* or *driver*. There is one of these pins on each side of the loom, and the two are connected by a cord to which a handle is attached. Holding this handle in his right hand, the weaver moves the two pins together in each direction alternately by a sudden jerk. A shuttle propelled in this manner is called a *fly-shuttle*, and was invented in 1738 by John Kay, a mechanic of Colchester, England. Before this invention the weaver took the shuttle between the finger and thumb of each hand alternately and threw it across, by which process much time was lost. There are also a great variety of automatic picker-motions for driving the shuttles of looms. Compare *picker-motion*.

The shuttle travels on a roller-carriage drawn by a cord in the shuttle-race below the warp-threads, and having also a set of upper rollers. The shuttle has also a pair of under rollers, one at each end, and travels over the lower series of warp-threads through the shed, being pushed along by the carriage while the warp-threads are passed, without straining them, between the upper rollers of the carriage and the rollers of the shuttle. Compare *positive-motion loom*, under *loom*.—**Weaver's-shuttle**, in *conch.*, a shuttle-shell, as *Radius volva*. See cut under *shuttle-shell*.

The root is appar. *σιβ-*, which is perhaps = L. *sib-* in *per-sibus*, acute, wise, and related to Gr. *σοφός*, wise (see *sophist*), and L. *sapere*, be wise, perceive: see *sapient*, *sage*[1].] **1.** In *anc. myth.*, one of certain women reputed to possess special powers of prophecy or divination and intercession with the gods in behalf of those who resorted to them. Different writers mention from one to twelve sibyls, but the number commonly reckoned is ten, enumerated as the Persian or Babylonian, Libyan, Delphian, Cimmerian, Erythræan, Samian, Cumæan, Hellespontine or Trojan, Phrygian, and Tiburtine. Of these the most celebrated was the Cumæan sibyl (of Cumæ in Italy), who, according to the story, appeared before Tarquin the Proud and offered him nine books for sale. He refused to buy them, whereupon she burned three, and offered the remaining six at the original price. On being again refused, she destroyed three more, and offered the remaining three at the price she had asked for the nine. Tarquin, astonished at this conduct, bought the books, which were found to contain directions as to the worship of the gods and the policy of the Romans. These sibylline books, or books professing to have this origin, written in Greek hexameters, were kept with great care at Rome, and consulted from time to time by oracle-keepers under the direction of the senate. They were destroyed at the burning of the temple of Jupiter in 83 B. C. Fresh collections were made, which were finally destroyed soon after A. D. 400. The Sibylline Oracles referred to by the Christian fathers belong to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with probably here and there a snatch from the older pagan source. In composition they seem to be of various dates, from the second century before to the third century after Christ.

[*Sick* is used as the first or the second element of some compounds, the other element in the former case naming something used for or on account of the sick or a sick person, and in the latter expressing the cause or occasion of sickness: as, *sick*-bed, -room, -diet, etc.; love-*sick*; home*sick*.]=**Syn.** *Sick*, *Ill*, *Ailing*, *Unwell*, *Diseased*, *Morbid*, *Sickly*. *Sick* and *ill* are general words for being positively out of a healthy state, as *ailing* and *unwell* are in some sense negative and therefore weaker words for the same thing. There has been some tendency in England to confine *sick* to the distinctive sense of 'nauseated,' but in America the word has continued to have its original breadth of meaning, as found in the Bible and in Shakspere. *Diseased* follows the tendency of *disease* to be specific, as in *diseased* lungs, or a *diseased* leg — that is, lungs or a leg affected by a certain disease; but the word may be used in a general way. *Morbid* is a more technical or professional term, indicating that which is not healthy or does not act in a healthy way; the word is also the one most freely used in figurative senses: as, *morbid* sensitiveness, self-consciousness, or irritability. *Sick* and *ill* apply to a state presumably temporary, however severe; *sickly* indicates a state not quite equal to sickness, but more permanent, because of an underlying lack of constitutional vigor. See *illness*, *debility*, *disease*.

It is characterized by monœcious flowers, with broadly bell-shaped or flattened five-toothed calyx, and five-parted wheel-shaped corolla, the stamens in the male flowers united into a short column bearing from two to five sessile curved or flexuous anthers. The ovary in the female flowers is bristly or prickly, and is crowned with a short style divided into three stigmas, producing a small flattened coriaceous or woody fruit with acute or long-beaked apex, commonly set with many sharp needles, and filled by a single large seed. There are about 35 species, natives of warm parts of America, one, *S. angulatus*, extending to Kansas and Canada. They are smooth [or rough-hairy climbers, or sometimes prostrate herbs, and bear thin, angled leaves, three-cleft tendrils, and small flowers, the fertile commonly clustered at the base of a staminate raceme. See *one-seeded* or *star cucumber*, under *cucumber*.

Sida (sī'dä), *n.* [NL. (Linnæus, 1735), < Gr. σίδη, the pomegranate, a water-lily, also, in Theophrastus, a plant of the genus *Althæa* or other malvaceous plant.] 1. There are about 75 species, natives of warm climates, mostly American, with about 17 in Australia and several in Africa and Asia. They are either herbs or shrubs, generally downy or woolly, and bearing flowers sometimes large and variegated, but in most species small and white or yellow. ★**side**[1] (sīd), *n.* and *a.* [< ME. *side*, *syde*, rarely *sithe*, < AS. *sīde* = OS. *sīda* = OFries. *sīde* =

Cf. *beside*, *besides*.] **I.** *n.* **1.** One of the two terminal surfaces, margins, or lines of an object or a space situated laterally to its front or rear aspect; a part lying on the right or the left hand of an observer, with reference to a definite point of view: as, the *sides* of a building (in contradistinction to its front and rear or back, or to its ends); the *sides* of a map or of a bed (distinguished from the top and bottom, or from the head and foot, respectively).

2. (*b*) The whole or a part of the body in front of or behind a vertical transverse plane: as, the front *side;* the hinder *side;* the dorsal *side*. (*c*) A part of the body lying laterally with reference to any given or assumed axis, and opposed to another similar or corresponding part: as, the front or back *side* of the arm. (*d*) A surface or extent of any body, or part of any body, that is external or internal, considered with reference to its opposite: as, the inner or outer *side*. See *inside*, *outside*. (*e*) Especially, that part of the trunk of an animal which lies or extends between the shoulder and the hip, and particularly the surface of such part; the lateral region or superficies of the chest and belly.

Lest you the Softness of the Sex forsake.
Congreve, tr. of Ovid's Art of Love, iii.

(*f*) One of the two most extensive surfaces of anything, being neither top or bottom, nor end, nor edge or border. [Since every organism, like any other solid, has three dimensions, to the extent of which in opposite directions *side* may be applied, it follows that there are three pairs of sides, the word having thus three definitions; a fourth sense is that which relates to the exterior and the (often hollow) interior; a fifth is a definite restriction of right and left *sides;* and a sixth is a loose derived application of the word, without reference to any definite axes or planes.]

3. One of the continuous surfaces of an object limited by terminal lines; one of two or more bounding or investing surfaces; a superficial limit or confine, either external or internal: as, the six *sides* of a cube (but in geometry the word is not thus used for *face*); the *side* of a hill or mountain (hill*side*, mountain-*side*); the upper and under *sides* of a plank; the right and wrong *sides* of a fabric or garment (see phrase below); the *sides* of a cavern or a tunnel. The word *side* may be used either of all the bounding surfaces of an object, as with certain prisms and crystals, or as exclusive of parts that may be called *top*, *bottom*, or *end*, as with a cubical box, a plank, etc.

Men seith that dune-is [hill's] *sithen* on

Milton, Comus, l. 295.

4. One of the extended marginal parts or courses of a surface or a plane figure; one of any number of distinct terminal confines or lateral divisions of a surface contiguous to or conterminous with another surface: as, the opposite *sides* of a road or a river; the east and west *sides* of the ocean; all *sides* of a field. The outer parts of an oblong or an irregular surface may all be called *sides*, or distinguished as the long and short *sides*, or as *sides* and *ends*, according to occasion. *Side* in this sense is more comprehensive than *margin*, *edge*, *border*, or *verge* (commonly used in defining it), since it may be used so as to include a larger extent of contiguous surface than any of these words. Thus, the sides of a room may be all the parts of its floor-space not comprised in a central part reserved or differentiated in some special way. The sides of a table are those marginal parts upon which food is served. The east and west sides of a continent may constitute jointly the whole of it, or may consist of larger or smaller marginal stripes or divisions, according as they are considered as separated by a mesial line or by some intervening region. The amount of latitude with which the word may be used in particular cases does not admit of definitive discrimination; but there is usually no difficulty in determining the intention of a writer or speaker in his employment of it.

A great market-place
Upon two other *sides* fills all the space.
William Morris, Earthly Paradise, I. 4.

5. Position or place with reference to an intermediate line or area; a space or stretch divided from another by the limit or course of something: preceded by *on* and followed by *of*, either expressed or (sometimes) understood: as, a region *on* both *sides of* a river; we shall not meet again this *side* the grave.

Thus, the "*sidereal* spaces" are the "*stellar* spaces," and "*sidereal* gold" is "*starry* spangles."

Sidereal clock or **chronometer**, a clock or chronometer that keeps sidereal time.—**Sidereal day, hour, month.** See the nouns.—**Sidereal magnetism**, according to the believers in animal magnetism, the influence of the stars upon patients. *Imp. Dict.*—**Sidereal system**, the system of stars. The solar system is considered a member of the sidereal system, in the same sense as the earth with its moon, and Saturn with its satellites, are considered members of the solar system.—**Sidereal time**, time as measured by the apparent diurnal motion of the stars. The sidereal day, the fundamental period of sidereal time, is taken to begin and end with the passage over the meridian of the vernal equinox, the first point of Aries, or the origin of right ascension (three names for the same thing). There is just one more sidereal than mean solar day in a sidereal year. The sidereal day is 3m. 55.901 s. shorter than a mean solar day. The sidereal time of mean noon is 0 hours on March 22d (21st, leap-years), 6 hours on June 21st, 12 hours on September 20th (21st, years preceding leap-years), and 18 hours on December 21st (20th, leap-years). These dates are for the meridian of Washington. For Greenwich it is 0 hours on March 22d in all years, and 6 hours on June 22d in years preceding leap-years. Sidereal time is the only uniform standard of time-measurement; and this cannot be absolutely uniform, since the friction of the tides must tend to retard the motion of the earth.—**Sidereal year**, the time in which the earth makes one complete revolution round the sun. The ratio of the sidereal year to the tropical year is that of unity to unity minus the quotient of the yearly precession by 360°—that is, it is longer than the tropical year by 20m. 23.3s.; its length is thus 365 days 6 hours 9 minutes 9.5 seconds.

It is isomorphous with calcite (calcium carbonate) and the other rhombohedral carbonates of magnesium, zinc, and manganese. It also occurs in granular, compact forms; in spheroidal concretionary forms with fibrous structure (sphærosiderite); and in earthy or stony forms, impure from the presence of sand or clay, and then called *clay ironstone.* It is one of the important ores of iron. Also called *chalybite, spathic* or *sparry iron, junckerite, junkerite.* The term *siderite* is used only as meaning chalybite, spathic iron, or carbonate of iron by scientific men at the present time.

Sideritis (sid-ē-rī'tis), *n.* [NL. (Tournefort, 1700), < L. *sideritis*, vervain, < Gr. *σιδηρῖτις*, an uncertain herb, fem. of *σιδηρίτης*, of iron: see *siderite.*] A genus of dicotyledonous sympetalous plants of the family *Menthaceæ*, tribe *Marrubieæ.* It is characterized by flowers with a five-toothed tubular calyx within which the corolla-tube, stamens, and style are all included, a corolla with the upper lip flattish and the lower with a larger middle lobe, and four didynamous stamens, the anthers of the forward or longer pair usually only half-formed, those of the other pair of two diverging cells. There are about 80 species, natives of the Mediterranean region, abundant in western Asia and extending west to the Canaries. They are herbs or shrubs, usually densely woolly or velvety, with entire or toothed leaves, and small and generally yellowish flowers in axillary whorls or crowded into a dense spike. siderolite (sid'ē-rō-līt), *n.* [< Gr. *σίδηρος*, iron, + *λίθος*, stone.] 1. A name first given by N. S. Maskelyne (in the form *aëro-siderolite*) to those meteorites which G. Rose had previously called *pallasites.* For meteorites consisting chiefly of metallic (nickeliferous) iron the name *siderite* was proposed by C. U. Shepard, and that of *holosiderite* by Daubrée; but the former is not admissible, because this name was long ago preoccupied by a well-known and widely distributed mineral species, and the latter cannot be accepted, because the majority of the specimens so designated are not wholly of iron. The name *siderolite* has therefore been transferred by M. E. Wadsworth to those meteorites which are composed chiefly of iron — in most cases, however, inclosing more or less irregular and nodular masses of pyrrhotite, schreibersite, graphite, etc. The same author includes in *siderolite* masses of iron of similar character although of terrestrial origin, as those of Ovifak in Greenland. In composition and appearance it somewhat resembles yellow ocher, but it is deeper in tint and of a browner hue. It gives a highly chromatic orange-yellow, considerably darkened, its luminosity being about half that of a bright chrome-yellow. Its transparency is one of its important qualities, while opacity should be the characteristic of an ocher. *Burnt sienna* is the raw material roasted in a furnace before powdering. By this means the color is changed to a warm reddish brown similar to old mahogany. It is, like raw sienna, translucent in body.

(Brongniart, 1822), < L. *sigillum*, a seal: see *sigil*.] A genus of Paleozoic fossil plants, type of the family *Sigillariaceæ*, in the order *Lycopodiales*, especially characteristic of the Middle Coal Measures. *Sigillaria* is a tree often of large size, and chiefly known by the peculiar markings on the trunk, which in some respects resemble those which characterize *Lepidodendron*. These markings are leaf-scars, and they occur spirally distributed around the stem, and generally arranged on vertical ridges or ribs. Great numbers of species have been described, the variations in the form and arrangement of the leaf-scars and of the vascular scars being the points chiefly relied on for specific distinction. The leaf of *Sigillaria* is similar in form and structure to that of *Lepidodendron*. The cones, somewhat resembling

Lepidostrobus, are pedicellate, the heterosporous sporangia being borne ventrally on the narrowed bases of the spirally arranged bracts. It thus appears that a portion, at least, of the sigillarias are very closely related to the lepidodendrons, though certain types of sigillarias are regarded by some paleobotanists as transitional to the gymnosperms.

The most common mathematical signs are those indicating the relations of quantities in arithmetical and algebraic processes. (See *notation*, 2.) The principal astronomical signs are those representing the names of the twelve divisions or constellations of the zodiac. (See def. 11.) Others symbolize the sun, the earth, and the other planets, the moon and its different phases, and the first twenty or more of the asteroids or planetoids. (See *symbol*.) All these, as well as the zodiacal signs, are in form significant of the names or the bodies for which they stand. The eight aspects have also signs, as follows: ☌ conjunction, ☍ opposition, △ trine, □ quadrature, ⚹ sextile, and three others very rarely used. In zoölogy two astronomical signs, ♂ and ♀, of Mars and Venus, are constantly used to denote male and female respectively; to which is sometimes added a plain circle, ○, meaning a young animal of undetermined sex. These signs for sex are in a good many of the cuts of insects figured in this volume (see, for example, *silk-spider*). In botany ⊙ indicates a monocarpic plant; ①, an annual; ⊛, a biennial; ♃, a perennial; ♄, a shrub; ♄, a tree; ♂, a male plant or flower; ♀, a female plant or flower; ☿, a hermaphrodite plant or flower; ∞, indefinitely numerous; ○=, cotyledons accumbent; ○‖, cotyledons incumbent, etc. The following signs are in common use in medicine and pharmacy: ℞, recipe; ℥, ounce; f℥, fluidounce; ʒ, dram; fʒ, fluidrachm; ℈, scruple; ♏, minim.

The medical theory based upon this conception, known as the *doctrine of signatures*, took note of color (as yellow flowers for jaundice and the bloodstone for hemorrhage), shape (as that of the roots of mandrake and ginseng), various peculiarities of marking, etc. Many existing names of plants, minerals, etc., originated from this theory. See *kidneywort*, *mandrake*, *scorpion-grass*. Also called *sign*, *seal*, and *sigil*.

3. The name of a person, or something used as representing his name, affixed or appended to a writing or the like, either by himself or by deputy, as a verification, authentication, or assent (as to a petition or a pledge). The initials, the first or familiar name by which one is known, or the mark or sign of the cross, and the like, if affixed by the person for that purpose, is a legal signature. A British peer uses his title as signature: thus, the Marquis of Salisbury signs himself simply "Salisbury." Prelates of the Church of England adopt signatures from the Latinized designations of their sees: thus, the Archbishop of Canterbury (E. W. Benson) signs himself "E. W. Cantuar."; the Bishop of Oxford (W. Stubbs), "W. Oxon." See *sign*, *v. t.*, 2, 3.

4. In *Scots law*, a writing formerly prepared and presented by a writer to the signet to the baron of exchequer, as the ground of a royal grant to the person in whose name it was presented. This, having in the case of an original charter the sign manual of the sovereign, and in other cases the *cachet* appointed by the act of union for Scotland, attached to it, became the warrant of a conveyance under one or other of the seals, according to the nature of the subject or the object in view. *Imp. Dict.*

5. A letter or figure placed by the printer at the foot of the first page of every section or gathering of a book. The letters begin with A, the figures with 1, and follow in regular order on succeeding sections. They are intended to aid the binder in folding, collating, and arranging the sections consecutively. In early printed books the signature-mark was often repeated on the 3d, 5th, and 7th pages of a section of 16 pages as an additional safeguard for the folder: as, A on 1st page, A i on 3d, A ii on 5th, and A iv on 7th page. This practice has been discontinued except for offcuts of 12mos, which have the signature repeated.

Hence—**6.** A sheet; especially, in bookbinders' use, a sheet after it has been folded and is ready to be gathered.—**7.** In *musical notation*, the signs placed at the beginning of a staff to indicate the key (tonality) and the rhythm of a piece. The term properly includes the clef (which see), since it determines the form of the key-signature. The key-signature consists of sharps or flats placed upon the degrees corresponding to the black digitals of the keyboard that are to be used; their number and position show also the position of the key-note. The key-signature of a minor key is the same as that of its relative major key. A key-signature made up of sharps is called a *sharp signature*; one made up of flats is called a *flat signature*. The key-signature may be altered in the course of the piece. In this case a heavy bar is inserted, and the sharps or flats that are not to continue in force are nullified by cancels (naturals) prefixed to the new signature. The key-signatures most in use with the common G and F clefs are as follows:

Some slight variations in the above forms occur. (See *key*[1], *key-signature*, and *circle of keys* (under *circle*).) The rhythmical signature, or time-signature, consists of two numerals, the upper of which indicates the number of principal beats in the measure, and the lower the kind of note chosen to represent one such beat. (See *rhythm*, and *rhythmical signature* (under *rhythmical*).) The key-signature is usually repeated at the beginning of every brace; but the rhythmical signature is given but once.

The signet in Scotland is a seal by which royal warrants connected with the administration of justice were formerly authenticated. Hence the title of *writers to the signet* or *clerks of the signet*, a class of legal practitioners in Edinburgh who formerly had important privileges, which are now nearly abolished. They act generally as agents or attorneys in conducting causes before the Court of Session. In English administration the signet is one of the seals for the authentication of royal grants, which before the abolition of the signet-office in 1848 was there affixed to documents before passing the privy seal, but it is not now required.

Caroliniana*, a glutinous early-flowering species, is the wild pink of the eastern United States (see cut under *anthophore*). (For *S. Virginica*, see *fire-pink*, under *pink*[2].) Many species with an inflated bladdery calyx are known in general as *campion*, among which *S. Otites*, abundant in sands of eastern Europe and known as *Spanish campion*, is used as an astringent. (For *S. acaulis*, also known in England as *cushion-pink*, see *moss-campion*.) *S. vulgaris*, the bladder-campion, is a wide-spread species of Europe, central and northern Asia, now introduced in the Atlantic United States. It is also called *behen* and *spatling-poppy;* also, from the shape of its calyx, in America *cowbell*, in England *knapbottle* and *whitebottle*. *S. maritima* of the English coast has been called *witches'-thimble*.

Sileneæ (sī-lē'nē-ē), *n. pl.* [NL. (A. P. de Candolle, 1824), < *Silene* + *-eæ*.] A tribe of dicotyledonous choripetalous plants of the family *Silenaceæ*. In the system of Bentham and Hooker it included 11 genera, all natives of the old world except certain species of *Dianthus* and *Silene*. (See also *Saponaria, Lychnis*, and *Gypsophila*.) It is equivalent to the subfamily *Silenoideæ* of Engler and Prantl, who divide it into two tribes, the *Lychnideæ* and *Dianthеæ*, including together 18 genera, the increase being chiefly due to the subdivision of the large comprehensive genera, *Lychnis* alone furnishing four of the additions. Most of the genera are cultivated for their ornamental flowers, as the pink, catch-fly, etc., which resemble salver-shaped flowers, as phlox, in form, but are composed of separate petals.

silent (sī'lent), *a.* and *n.* [Early mod. E. also *sylent;* = It. *silente*, < L. *silen(t-)s*, ppr. of *silere*, be silent; cf. > Hear me for my cause, and be *silent* that you may hear.
> *Shak.*, J. C., iii. 2. 14.

2. In a restricted use, not given to speaking; using few words; not loquacious.

Which, sparckling on the *silent* waves, does seeme more bright.
Spenser, F. Q., II. xii. 78.

If you find yourself approaching to the *silent* tomb, Sir, think of me. *Dickens*, Martin Chuzzlewit.

Silent-alarm system. See *fire-alarm telegraph*, under *fire-alarm*.—**Silent letter**, a letter of a word which is not sounded or pronounced in the enunciation of the word, as the *b* in *doubt*, the *c* in *victual*, the *d* in *handsome*, the second of the two *l* like consonants in *ebb*, *odd*, *off*, etc. The silent letter may be wholly useless, as in the above examples, or it may serve as an accidental or conventional index of the sound given to some adjacent letter: thus, the *e* in *bate*, *mete*, *bite*, *note*, *mute*, etc., is silent, but it indicates that the preceding vowel is long; the *c* in *indict*, the *g* in *sign*, the *l* in *balm*, etc., serve a similar purpose. Silent letters are traditional, representing sounds that once existed in the word, either in English or in the original tongue (as the *p* and *l* in *psalm*, pronounced in Latin *psalmus*, Greek ψαλμός), though often, as in this case, artificially restored after having been omitted (AS. *sealm*, ME. *salm*, *saume*), or have been foisted in to suit some false etymology or erroneous analogy, as the *l* in *could*, the *g* in *foreign*, the *p* in *ptarmigan*, etc. The proportion of silent letters in the present English spelling is about 12½ per cent.—**Silent spirit**, distilled spirit which is nearly destitute of special flavor and odor. Compare *silence*, 4.—**Silent system**, a system of prison discipline which imposes entire silence among the prisoners, even when assembled together.—**Silent Week**, Holy Week. Also *Still Week*.—**The Silent Sister**, an ironical name of Ireland.=**Syn. 1** and **2.** *Silent*, *Taciturn*, *Dumb*, *Mute*. *Silent* expresses the fact of not speaking, *taciturn* the habitual disposition to refrain from speaking. *Dumb* strictly implies lack of the organs of speech, or defect in them, or lack of the power of speaking, while *mute* implies some special cause: hence *deaf-mute* is thought by many a better name than *deaf-and-dumb person* for one who does not speak on account of deafness; an idol is *dumb*, not *mute*. Under figurative extension *mute*, *dumb*, and *silent* are often used outside of the lines here indicated. In such freer use there is an advance in strength from *silent* to *mute* and from *mute* to *dumb*: as, *silent* from abstraction; *mute* with astonishment; struck *dumb* with horror.

II. *n.* **1.** A silent period. [Rare.]

Silhouette portraits were very common throughout the early years of the nineteenth century, and are often cut out of black paper.

silica (sil′i-kạ), *n.* [NL., < L. *silex* (*silic-*), flint: see *silex*.] Silicon dioxid (SiO_2), or silicic anhydrid, a white or colorless substance, nearly insoluble in water and in all acids except hydrofluoric acid. Silica is extremely hard, and fuses with difficulty in the oxyhydrogen flame to a colorless amorphous glass. In nature, as quartz, it is universally distributed, and is the commonest of minerals; here belong the varieties rock-crystal, amethyst, chalcedony, agate, carnelian, onyx, jasper, flint, hornstone, etc., which differ in degree of crystallization and in purity, and hence in color. Silica in the form of quartz makes the sand of the sea-shore, and rock-masses as quartzite and sandstone. It also occurs as the rare mineral tridymite, known only in volcanic rocks and in a few meteorites, and as the amorphous opal, which is softer and more soluble than quartz and contains more or less water. (See *quartz*, *tridymite*, *opal*, also *asmanite*, *cristobalite*, *melanophlogite*.) Silica also forms the material of the spicules of many sponges and of the frustules of diatoms; deposits of the latter are not uncommon under peat-swamps, and in some regions vast beds have been accumulated. (See *infusorial earth*, under *infusorial*.) It combines with basic oxids to form compounds called *silicates*, which constitute the rocky crust of the globe. It occurs in solution in the waters of many mineral springs, and sometimes is deposited in enormous quantities about geyser-basins. From the silicates taken up by plants silica is often deposited on the surface or in the interior of their stems. The value of the equisetum, or scouring-rush, is due to the silica contained in it, which sometimes amounts to 18 per cent. of the fresh plant. Sand is extensively used for the manufacture of glass and mortar. The prominent silicates recognized among minerals are the *metasilicates*, salts of metasilicic acid (H_2SiO_3), and *orthosilicates*, salts of orthosilicic acid (H_4SiO_4). Examples are rhodonite, or manganese metasilicate ($MnSiO_3$), and willemite, or zinc orthosilicate (Zn_2SiO_4). There are also disilicates, polysilicates, etc., but they are rarer, and their nature is less clearly understood. See *glass*, *mortar*[2], and *sand*[1]. Also called *silex*.—**Infusorial silica.** Same as *infusorial earth* (which see, under *infusorial*).—**Silica bandage**, in *surg.*, a bandage which is moistened with sodium silicate after having been applied.

silicate (sil′i-kāt), *n.* [< *silic-ic* + *-ate*[1].] A salt of silicic acid. Silicates formed by the union of silicic acid with the bases alumina, lime, magnesia, potassa, soda, etc., constitute by far the greater number of the minerals which compose the crust of the globe. Glass is a mixture of artificial silicates of alkalis and alkaline earths or metallic oxids (see *glass*).—**Silicate cotton.** See *cotton*[1].

All the existing horny or fibrous sponges are supposed to have been derived from *Silicea* which have lost their spicules, or replaced them by a fibrous skeletal support. The *Silicea*, as a subclass of *Spongiæ*, are divided by Von Lendenfeld into three orders—*Hexactinellida*, *Chondrospongiæ*, and *Cornacuspongiæ*.

The acid is a colloid, and is obtained in an aqueous solution, which if concentrated sets to a jelly. Silicic acid has not yet been obtained in the pure form, as it undergoes decomposition into water and silica when dried. There are several hypothetical silicic acids, from which the several classes of silicates are supposed to be formed. Such are orthosilicic acid (H_4SiO_4), metasilicic acid (H_2SiO_3), and parasilicic acid (H_8SiO_5). None of these acids has been isolated.—**Silicic ether**, a compound of silicic acid with an alkyl, as methyl silicate ($(CH_3)_4SiO_4$).

Agatized and jasperized wood admitting of a fine polish, and of the richest red, yellow, and brown colors, occurs in immense quanti-

In the widest sense the *Silicispongiæ* include all non-calcareous sponges, whether silicious spicules are present or not, and are the same as *Silicea*, 2. In Sollas's classification the term is restricted to *Micromastictora* having a skeleton the scleres of which are not calcareous, being thus the silicious sponges without the *Myxospongiæ*. silicon (sil′i-kon), *n.* [< NL. *silicon*, < L. *silex* (*silic-*), flint: see *silex*, *silica*.] Chemical symbol, Si; atomic weight, 28.3. A non-metallic element which is obtained in three allotropic forms—namely, amorphous, as a dull-brown powder soluble in alkali, which burns when ignited; graphitic, in crystalline leaves having a strong metallic luster and lead-gray color, insoluble in alkali and non-combustible; and crystalline, in octahedral needles having a red luster, and hardness notably less than that of the diamond. Next to oxygen, silicon is the most abundant element in nature. It is found only in combination, chiefly with oxygen, forming silicon dioxid, or silica, which combined with bases makes up the larger part of the rock-crust of the globe. Also called *silicium*.—**Silicon-brass**, brass prepared with the addition of a small amount of silicon, by which its valuable qualities are said to be improved.—**Silicon-bronze**, bronze or copper with the addition of a small amount of silicon-copper, by which its valuable properties for certain uses, as for telegraph-wire, are said to be considerably improved. Weiller's silicon-bronze telegraph-wire was found by analysis to consist of almost chemically pure copper, with 0.02 per cent. of silicon. The silicon-bronze telephone-wire of the same maker contained 1.02 per cent. of zinc, 1.14 of tin, and 0.05 of silicon. The addition of the silicon in the manufacture of silicon-bronze seems to have no other effect than that of entirely removing the oxygen of the copper.—**Silicon-iron**, iron containing a large proportion of silicon (as much, in some instances, as 10 to 14 per cent.), prepared for use in improving the quality of cast-iron, especially for foundry use, which it is now believed to do by its action on the carbon which the iron contains, an increase of silicon changing combined carbon to graphitic, and vice versa. Also called *high-silicon iron*, and, of late more generally, *ferro-silicon*. "When the founder understands its [silicon's] use, he may soften and toughen, or harden and strengthen his iron to suit his requirements." (*Keep and Orton*, Trans. Amer. Inst. Min. Eng. (1888–9), XVII. 253.)—**Silicon ware**, a kind of stoneware introduced about 1883 by the Lambeth potteries: it is colored in the body, usually a deep red, with applied ornaments, very slightly glazed, somewhat resembling Wedgwood ware in surface.

The Chinese word is prob. not connected with the European, except that the Gr. Σῆρες may mean the Chinese, and be based on the Chinese name for silk. For the more common Teut. word for 'silk,' see *say*⁴.] **I.** *n.* 1. A fine soft thread produced chiefly by the larvæ of various bombycid moths, especially of *Bombyx* (*Sericaria*) *mori*, known as *silkworms*, feeding on the leaves of the mulberry and several other trees. (See *Bombyx* and *silkworm*, and compare *gut*, 4.) Silk is the strongest, most lustrous, and most valuable of textile fibers. The thread is composed of several finer threads drawn by the worm from two large organs or glands containing a viscid substance, which extend, as in other cocoon-making caterpillars, along a great part of the body and terminate in two spinnerets at the mouth. With this substance the silkworm envelops itself, forming its cocoon. *Raw silk* is produced by the operation of winding off at the same time several of these cocoons, after they have been immersed in hot water to soften the natural gum on the filament, on a common reel, thereby forming one smooth, even thread. Before it is fit for weaving it is converted into one of three forms, namely *singles*, *tram*, or *organzine*. *Singles* (a collective noun) is formed of one of the reeled threads, twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together, and is commonly used in weaving as the *shoot* or *weft*. (For *organzine*, see *thrown silk*, below.) Silk of various qualities (but none fully equal to the preceding) is produced by different genera of the family *Saturniidæ*, particularly the tusser-worm of India, *Attacus mylitta*, the yama-mai of Japan, *Antheræa yama-mai*, etc., feeding on the oak and other plants.

In this sense the word has a plural, *silks*, denoting different sorts or varieties: as, black *silk*; white *silk*; colored *silks*.

★ **silo** (sī'lō), *n.* [= F. *silo*, < Sp. *silo*, silo, < L. *sirus*, < Gr. σιρός, σειρός, a pit to keep corn in, an underground granary, a pitfall.] A pit or chamber in the ground, or a cavity in a rock, or now, commonly, a tall, circular iron tank with a roof, for the storing of green crops for future use as fodder in the state called *ensilage*. The material is tightly packed in the silo soon after it is gathered (sometimes with addition of a little salt), covered, and pressed down with heavy weights. Thus it is subjected to fermentation, which, if not carried too far, is beneficial rather than injurious. The resulting fodder is analogous in its nutritious quality to sauerkraut, which is the product of fermentation of cabbage. Similar pits or cavities in the ground or in rock have been used from remote times, in various parts of the world, for the prolonged preservation of grain in a dry state, through the careful exclusion of air and moisture. See the supplement.

II. *n.* A name given by Murchison, in 1835, to a series of rocks the order of succession of which was first worked out by him in that part of England and Wales which was formerly inhabited by the Silures. The various groups of fossiliferous rocks included in the Silurian had, previous to Murchison's labors, been classed together as one assemblage, and called by the Germans *grauwacke*, sometimes Anglicized into *graywacke* (which see), also the *Transition series* or *Transition limestone*. In England and Germany these lower rocks have been greatly disturbed and metamorphosed, and have also been frequently invaded by eruptive masses; hence it was not until after considerable progress had been made toward a knowledge of the sequence of the higher fossiliferous groups that the lower (now designated as *Silurian* and *Devonian*) began to be studied with success. Almost contemporaneously with the working out of the order of succession of these lower rocks by Murchison in Great Britain, groups of strata of the same geological age, but lying for the most part in almost entirely undisturbed position, began to be investigated on and near the Atlantic coast of the United States, especially in New York, by the Geological Survey of that State, and a little later in Bohemia by Joachim Barrande. Murchison, Barrande, and James Hall, paleontologist of New York, all agreed as to the adoption of the name *Silurian*, and in regard to the essential unity of the series or system thus designated. The Silurian is the lowest of the four great subdivisions of the Paleozoic, namely, Silurian, Devonian, Carboniferous, and Permian. When undisturbed and unmetamorphosed, the Silurian is usually found to be replete with the remains of organic forms, virtually all of which are marine. The Silurian is divided into an Upper and a Lower Silurian, and each of these again is subdivided into groups and subgroups varying in nomenclature in various countries. The line between the Upper and Lower Silurian is now drawn in Great Britain at the top of the Caradoc or Bala group; in New York, at the top of the Lorraine shales. The scanty evidence of vertebrates and of land-plants, and the paucity of plant-life in general, are the most striking negative features of Silurian life. The most prominent forms of the animal kingdom were the graptolites, trilobites, eurypterids, cephalopods, and brachiopods, and of these the first-mentioned are the most characteristic of all, since they range through nearly the whole Silurian, and disappear in the Devonian; while the trilobites, which begin at the same time with the graptolites, continue through the Devonian, and end only with the Carboniferous. As the line between the Silurian and Devonian is commonly drawn in England — namely, so as to include in the former the Ludlow group — the first vertebrates, in the form of a low type of fishes, appear near the top of the Upper Silurian; traces of land-animals (scorpions) have also been found in the Upper Silurian of Sweden and Scotland; and in France, in the Lower (?) Silurian, traces of insect life. A scorpion has also been found in the United States, at Waterville, New York, in the Water-lime beds at the top of the Upper Silurian. Mr. Whitfield, by whom the specimen was described, inclines to the opinion that the species, for which he instituted a new genus (*Proscorpius*), was aquatic and not air-breathing, and that it forms a link between the true aquatic forms like *Eurypterus* and *Pterygotus* and the true air-breathing scorpions of subsequent periods. He intimates that the same is likely to be true of the Swedish and Scottish Silurian scorpions. The traces of land-plants in the Silurian are rare, and for the most part of doubtful identification. Algæ, on the other hand, are of somewhat frequent occurrence. The line between Silurian and Devonian in the United States is drawn at the top of the Manlius limestone or the base of the Helderbergian, and below this horizon a placoderm fish has been discovered in the Salina beds of Pennsylvania, *Palæaspis americana* (Claypole). All evidence of land-plants, however, is still very dubious. The Silurian rocks are widely spread over the globe, with everywhere essentially similar types of animal life. This part of the series is of importance in the United States, especially in the northeastern Atlantic States and in parts of the Mississippi valley.

Siluric (si-lū'rik), *a.* [< L. *Silures* (see *Silurian*) + *-ic*.] Same as *Silurian*. [Rare.]

silurid (si-lū'rid), *a.* and *n.* Same as *siluroid*.

Siluridæ (si-lū'ri-dē), *n. pl.* [NL., < *Silurus* + *-idæ*.] A very large family of physostomous fishes, of the order *Nematognathi*, represented by such forms as the sheat-fish of Europe and the catfishes or cats of America. It was the same as *Siluroides* of Cuvier. By Cope its name was used for *Nematognathi* with the anterior vertebræ regularly modified, the inferior pharyngeal bones separate, and an operculum developed. It thus contrasted with the *Aspredinidæ* and *Hypophthalmidæ*, and included all the *Nematognathi* except those belonging to the two families named. By Gill the family was restricted to those *Nematognathi* which have the anterior vertebræ regularly modified; the lower pharyngeal bones separate; the operculum developed; a dorsal fin, in connection with the abdominal portion of the vertebral column, rather short, and preceded by the spine; the pectoral fins armed with well-developed spines having a complex articulation with the shoulder-girdle; and the body naked, or with plates only along the lateral line. The lower jaw has no reflected lip, and there are usually from four to eight pairs of barbels, maxillary barbels being always developed. Species of the family thus limited are very numerous, several hundred having been described, and referred to many genera. Most of them inhabit fresh water, especially of tropical and subtropical countries, but many are also found in tropical seas. In Europe, one, the sheat-fish, *Silurus glanis*, oc-

curs in the central and eastern regions of the continent; while a second, more southerly, and supposed to be the glanis of the ancients, has lately (1890) been distinguished as *Silurus* (*Parasilurus*) *aristotelis*. In North America the family is represented by a number of species belonging to different subfamilies, which are generally known under the name of *catfishes*. The leading genera of North America are *Noturus*, stone-cats; *Amiurus*, ordinary cats, pouts, bullheads, etc.; *Ictalurus*, channel-cats; *Tachysurus*, sea-cats; and *Felichthys*, gaff-topsails. See also cuts under *catfish*, *gaff-topsail*, *pout*, and *stone-cat*.

A metal of a white color, having a specific gravity of 10.42 to 10.57 (according as it is cast, rolled, or hammered), harder than gold, and softer than copper, having a tenacity about equal to that of copper, and melting at a temperature a little lower than that metal. Its whiteness is remarkable, that of tin alone among the common metals nearly approaching it; among the rare metals, iridium and lithium are equal to silver in color and luster. Silver crystallizes in the regular (isometric) system; but, although native silver is of frequent occurrence, distinct crystals are very rare. Arborescent and filiform shapes are most common, but very large solid masses have been found. Silver occurs in a great variety of ores, being mineralized by sulphur, antimony, and arsenic, as well as by chlorin, iodine, and bromine. These ores are widely distributed over the world. Silver is very commonly associated with lead; and the common ore of the latter metal, galena, always contains some silver, and generally enough to make its separation remunerative. Silver has also been detected in the water of the ocean. The principal silver-producing regions are the Andes and Cordilleras. From Peru and Bolivia came an immense supply of this metal during the sixteenth and seventeenth centuries. Mexico has been a large producer of silver since the middle of the sixteenth century. The mines of the Comstock lode at Virginia City, in Nevada, produced about $320,000,000 worth of bullion from 1860 to 1890, about five twelfths of the value of which was silver. This metal has always been accounted "precious," and has been used for ornament and as a measure of value from the earliest times of which there is any historical record. Its most marked point of inferiority to gold, apart from color, is its liability to tarnish when exposed to sulphurous emanations or brought into contact with anything containing sulphur. Silver is too soft to be used in the unalloyed condition. The ratio of silver to copper in the silver coinage of England is 92½ to 7½ (or 12½ to 1); in that of France and the United States, 9 to 1; and in that of Prussia, 3 to 1. The world's production of silver has increased from 63,267,187 fine ounces (commercial value $82,120,800) in 1873 to 211,215,633 fine ounces (commercial value $108,776,048) in 1909. In the United States the production increased from 27,630,400 fine ounces in 1873 to 57,647,000 fine ounces in 1900. In 1909 it was 54,721,500 fine ounces (value $28,455,200). From the foundation of the government until 1873, when the free coinage of silver was stopped (see *coinage ratio, dollar*), about $8,000,000 were coined. Under the silver-purchase acts of 1878 and 1890 over $400,000,000 were coined. (See *silver certificate,* below.) The total amount of silver purchased by the government from Feb. 12, 1873, to Nov. 1, 1893 (when the purchase act of 1890 was repealed), was 496,984,889 ounces, at a cost of $508,933,975. Political agitation for the resumption of the free coinage of silver at the existing ratio (about 16 to 1) has been carried on vigorously in the West and South since about 1878; and in 1896 the Democratic party made this the chief plank in its platform, and was defeated on this issue.

2. Silver coin; hence, money in general.

The relative proportions of the metals in the alloy called German silver vary considerably, according to the desire of the manufacturer to produce a cheaper or more expensive article. The commonest kind contains about eight parts of copper, two of nickel, and three to five of zinc. A finer kind of alloy is obtained by adding more nickel; the metal is then less liable to tarnish, and the resemblance to silver in color and luster is more striking. Nickel is a much more expensive metal than copper, and very much more so than zinc. See *nickel.*—**King's silver.** (*a*) A name given to silver used in England from about 1700 to 1720 for plate of an unusually high standard: apparently introduced by workmen from the continent, and abandoned because not sufficiently hard and durable. Picea,* so called from the two silvery lines on the under side of the leaves. It is a native of the mountains of central and southern Europe, planted elsewhere. It grows from 80 to 120 or even 200 feet high. Its timber is soft, tough, and elastic, of a creamy-white color, useful for many building and cabinet purposes, for making the sounding-boards of musical instruments, toys, etc. It yields resin, tar, and the Strasburg turpentine. This is the "noble fir" (*edler Tannenbaum*) of the Germans. The silver fir of the Alleghany region, etc., is *A. balsamea,* mostly called *balsam* or *balm-of-Gilead fir.* It is a moderate-sized tree, its twigs sought for scented cushions, its bark secreting Canada balsam (see *balsam*), also the source of spruce-gum. Pacific North America presents several noble silver firs, as *A. grandis,* the white fir of Oregon bottom-lands, and *A. nobilis* and *A. magnifica,* the red firs of the mountains of Oregon and California, all trees between 200 and 300 feet in height.—**Silver fox,** the common red fox, *Vulpes fulvus,* in a melanistic variation, in which the pelage is black or blackish, overlaid with hoary or silver-gray ends of the longer hairs. It is an extreme case of the range of variation from the normal color, of which the cross-fox is one stage. It occurs in the red foxes of both America and Europe, especially in high latitudes, and constitutes the *Canis* or *Vulpes argentatus* or *argenteus* of various authors. The silver fox has sometimes been defined wrongly as a variety of the gray fox of the United States (*Urocyon cinereoargentatus*), perhaps by some misapprehension of Schreber's (1778) specific name, just cited; but this is a distinct species of a different genus, and one in which the silver-black variation is not known to occur. Compare cut under *cross-fox.*

While the Cross and Black and *Silver Foxes* are usually considered as different varieties, they are not such in the classificatory sense of that term, any more than are the red, black, or white wolves, the black marmots, squirrels, etc. The proof of this is in the fact that one or both of the "varieties" occur in the same litter of whelps from normally colored parents. They have no special distribution, although, on the whole, both kinds are rather northerly than otherwise, the *Silver Fox* especially so.

The law of similars. (*a*) The law of mental association by which similar ideas are connected in the mind and suggest one another. It has been much disputed whether there is such a thing as original similarity, apart from partial identity; and, if so, whether similars tend to associate. In Argument
Similies are like Songs in Love:
They much describe; they nothing prove.
Prior, Alma, iii.

=**Syn.** *Simile, Metaphor, Comparison, Allegory, Parable, Fable*, similitude, trope. The first six words agree in implying or expressing likeness between a main person or thing and a subordinate one. *Simile* is a statement of the likeness in literal terms: as, man is like grass; Herod is like a fox. *Metaphor* taxes the imagination by saying that the first object is the second, or by speaking as though it were: as, "All flesh is grass," Isa. xl. 6; "Go ye and tell that fox," Luke xiii. 32. There are various combinations of *simile* and *metaphor:* as, "We all do fade as a leaf," Isa. lxiv. 6;

"There are a sort of men whose visages
Do cream and mantle, like a standing pool"
(*Shak.*, M. of V., i. 1: 89).

In these the *metaphor* precedes; in the following the *simile* is in the middle of the *metaphor:* "These metaphysic rights, entering into common life, like rays of light which pierce into a dense medium, are, by the laws of Nature, refracted from their straight line." (*Burke*, Rev. in France.) In the same way the *simile* may come first. A *comparison* differs from a *simile* essentially in that the former fixes attention upon the subordinate object, while a *simile* fixes it upon the main one: thus, one verse of Shelley's "Ode to the Skylark" begins by saying that the skylark is like a poet, whose circumstances are thereupon detailed. Generally, on this account, the *comparison* is longer than the *simile.* The *allegory* personifies abstract things, usually at some length. A short *allegory* is Ps. lxxx. 8–16. Spenser's "Faery Queene" is a series of *allegories* upon the virtues, and Bunyan's "Pilgrim's Progress" allegorizes Christian experiences. These are acknowledged to be the most perfect *allegories* in literature. The *allegory* is an extended *simile*, with the first object in the *simile* carefully left unmentioned. A *parable* is a story that is or might be true, and is used generally to teach some moral or religious truth: as, the three *parables* of God's great love for the sinner in Luke xv. Socrates's story of the sailors who chose their steersman by lot, as suggesting the folly of a similar course in choosing the helmsman of the state, is a fine example of the *parable* of civil life. A *fable* differs from a *parable* in being improbable or impossible as fact, as in making trees choose a king, beasts talk, or frogs pray to Jupiter; it generally is short, and points a homely moral. See the definitions of *apologue* and *trope.*

simile (sim'i-le), *adv.* [It., ‹ L. *simile, similis*, like: see *similar, simile, n.*] In *music*, in the same manner; similarly. Compare *sempre.*
